

MacOS X for ITSS

Short Course

James Partridge

OUCS

9 June 2004

1. Introduction

- Background
- Goals of the course

“It makes me very happy to hear that you are as well a happy Mac user! For some reasons I got the impression that whole Oxford University is based on ‘poor’ PC’s, bearing in mind when I showed my Macintosh upon arrival to Oxford to [*IT Officer A*] and [*IT Officer B*] here at [*Unit*], they were loudly laughing at me and shaking their head off...”

We will...

- Describe layout of OS X file system
- Look at how to maintain healthy OS
- Look at installing & configuring common apps
- Discuss typical sw & hw problems
- Discuss solutions to typical problems

We won't...

- Get much actual hands-on (sadly) because of equipment restrictions
- Spend time discussing the apps themselves
- Rerun the "Intro to OS X" course going on next door
- Talk about OS9
- Be doing an advanced MacOS X user course

What about OS9 (and earlier)?

- Don't know much about it
- It's basically defunct anyway
- Not enough time to do both
- May touch on Classic environment.

2. OS & File System

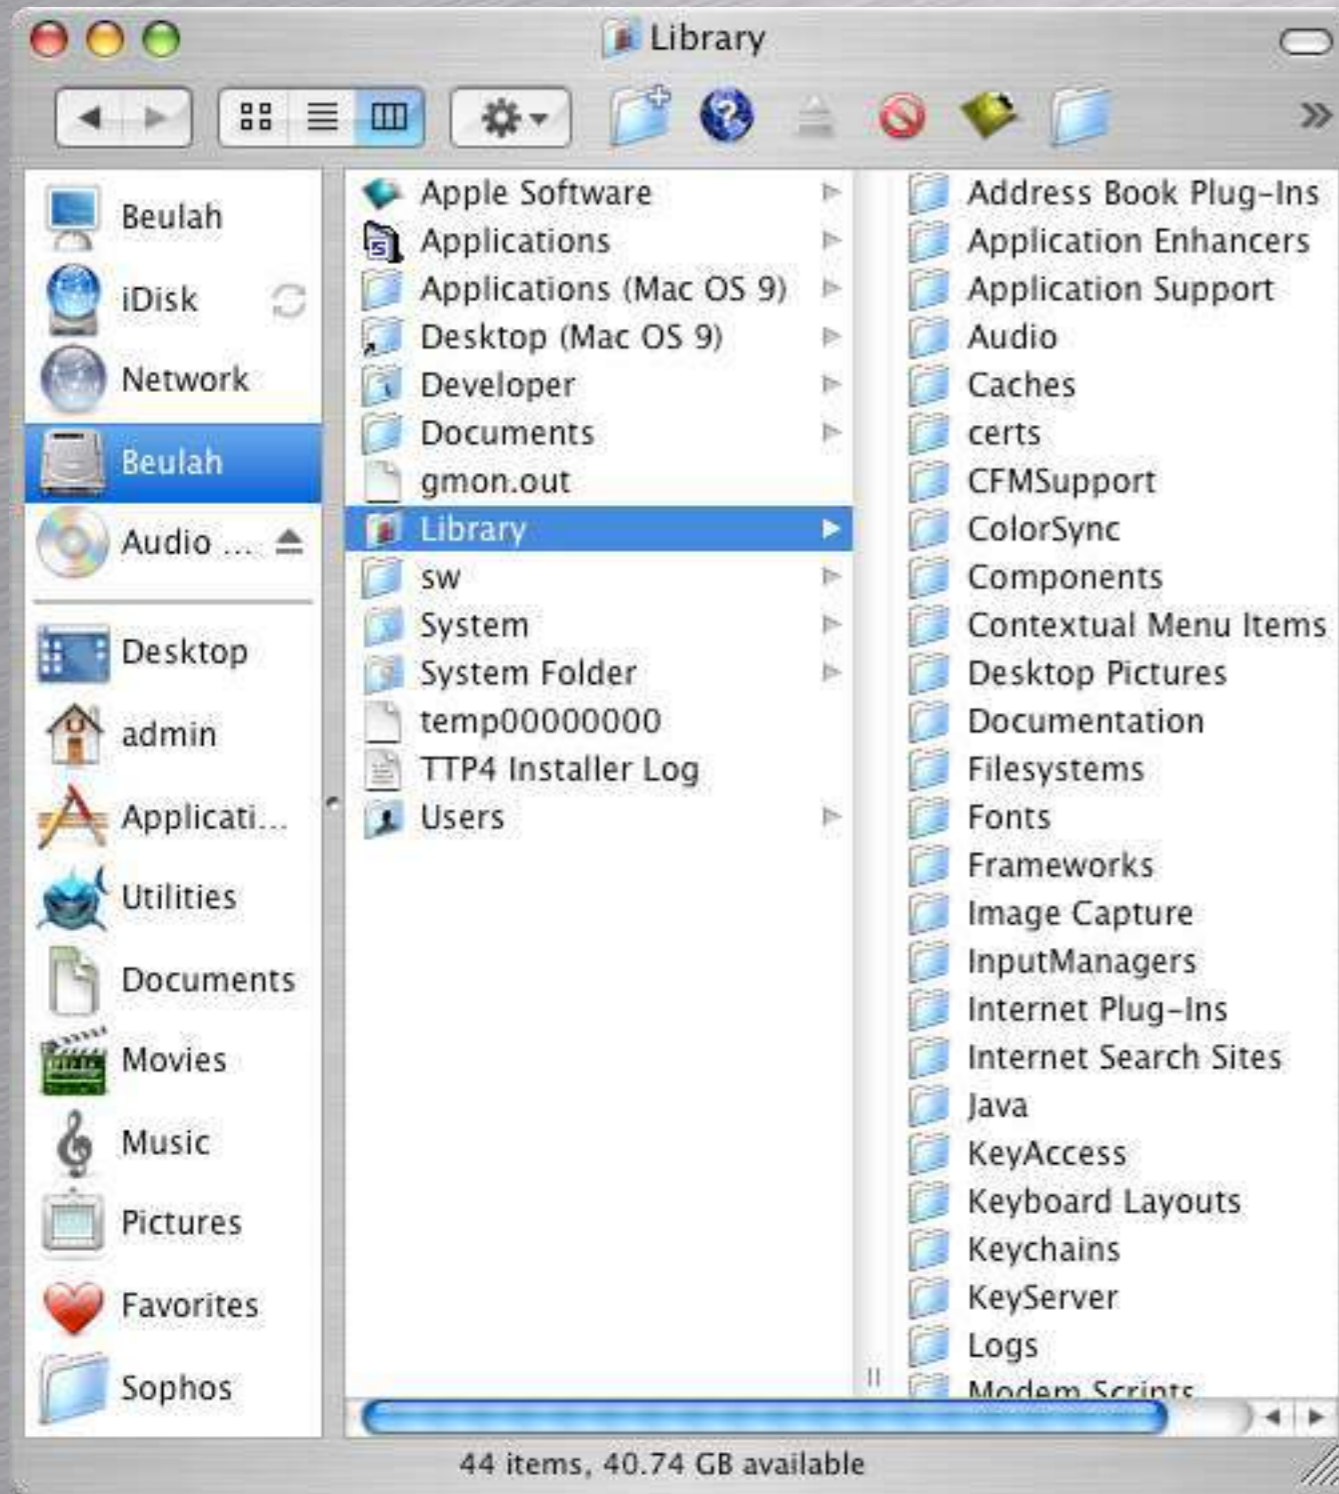

- Versions of the OS
- OS Structure

Versions of the OS

- **10.0 Cheetah** (proof-of-concept)
- **10.1 Puma** (public beta)
- **10.2 Jaguar** (first 'mature' version)
- **10.3 Panther** (current OS)
- [***10.4 Tiger*** (*tba on 28.6.04*)]

OS Structure

Four Domains:

- **User:** under complete control of current user (incl. Home folder)
- **Local:** Folders & files usable by all users of the machine; can be modified by admin users; not crucial to OS
- **Network:** as 'Local', but accessible to all users of a network and modifiable by Network admins
- **System:** Not intended for use by anyone but the system itself.

The Terminal View

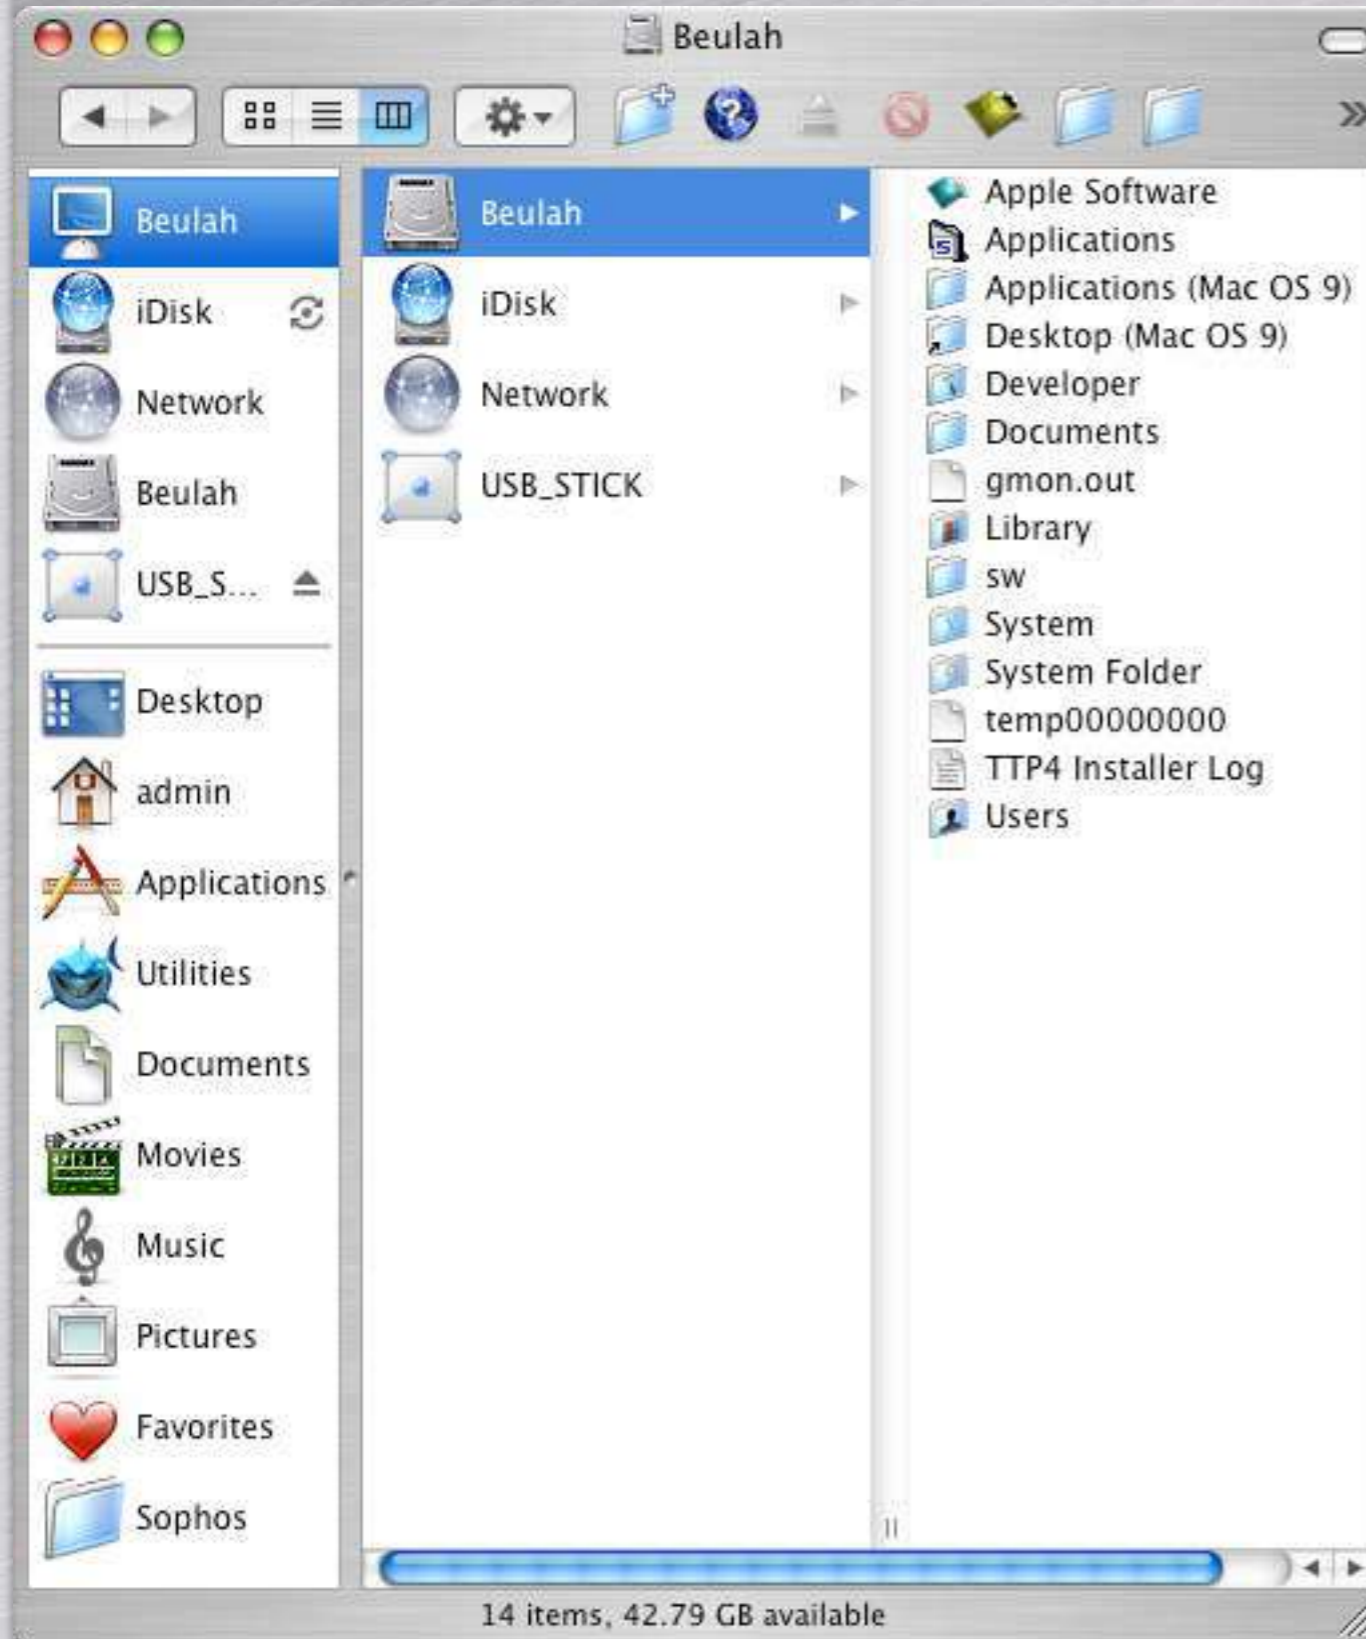

```
Beulah — tcsh
[beulah:/] admin% ls -al
total 419728
drwxrwxr-t  51 root  admin    1734 30 May 19:08 .

OSXforITSS

Kind: Keynote Document

Size: 13 MB on disk (13,381,490 bytes)

Where: Beulah:Users:admin:Documents:
OUCS In-House:Teaching:

Created: Monday, 31 May 2004 15:18

Modified: Friday, 4 June 2004 10:40

Stationery Pad

Locked

▶ Name & Extension:

▶ Open with:

▶ Preview:

▶ Ownership & Permissions:

▶ Comments:

`/Library` (Macintosh HD:Library)

- `/Library/Application Support/Sophos Anti-Virus/IDEs`
- `/Library/Preferences` (but only for TSM unless certain)
- `/Library/Desktop Pictures`
- `/Library/Documentation`
- `/Library/Logs`
- `/Library/Packages` (good if you download from SU rather than just installing)
- `/Library/Receipts`
- `/Library/Scripts`

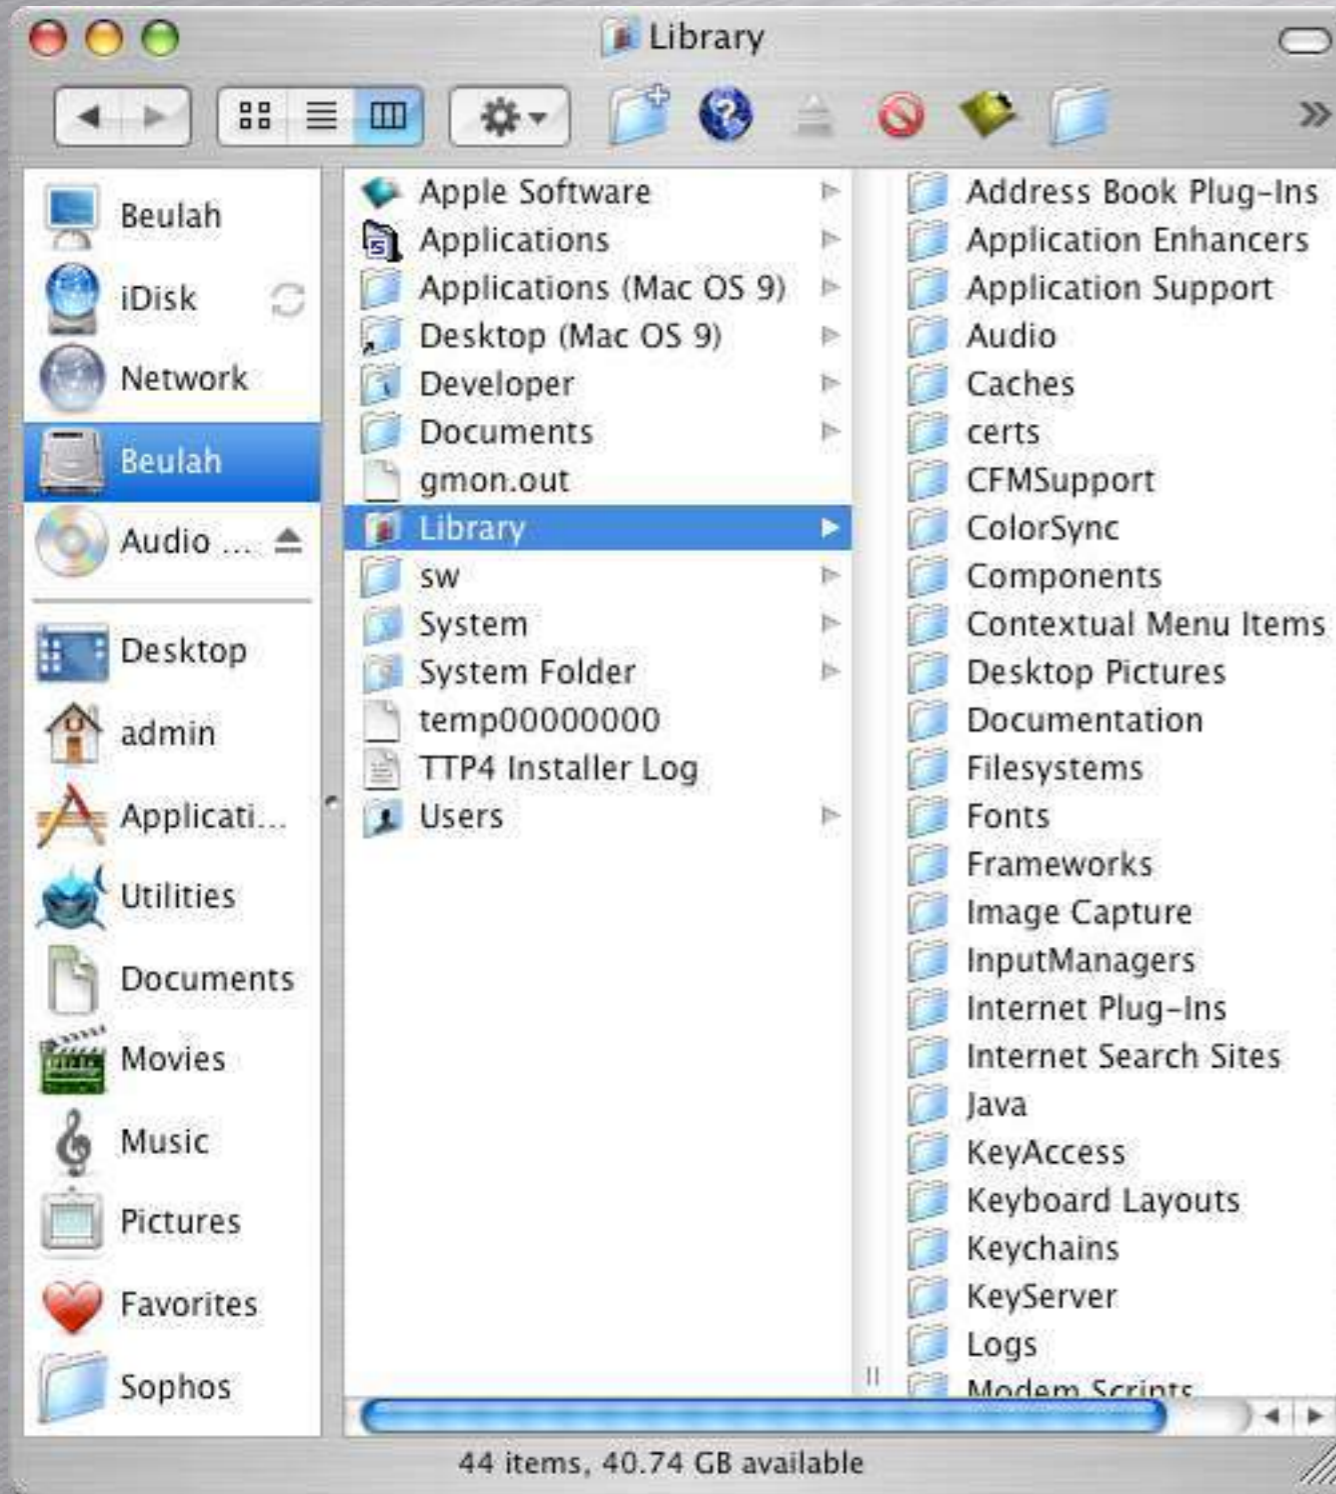

**Careful with `/Library`,
although it's not *usually*
too catastrophic if
something does go
wrong.**

/System/Library

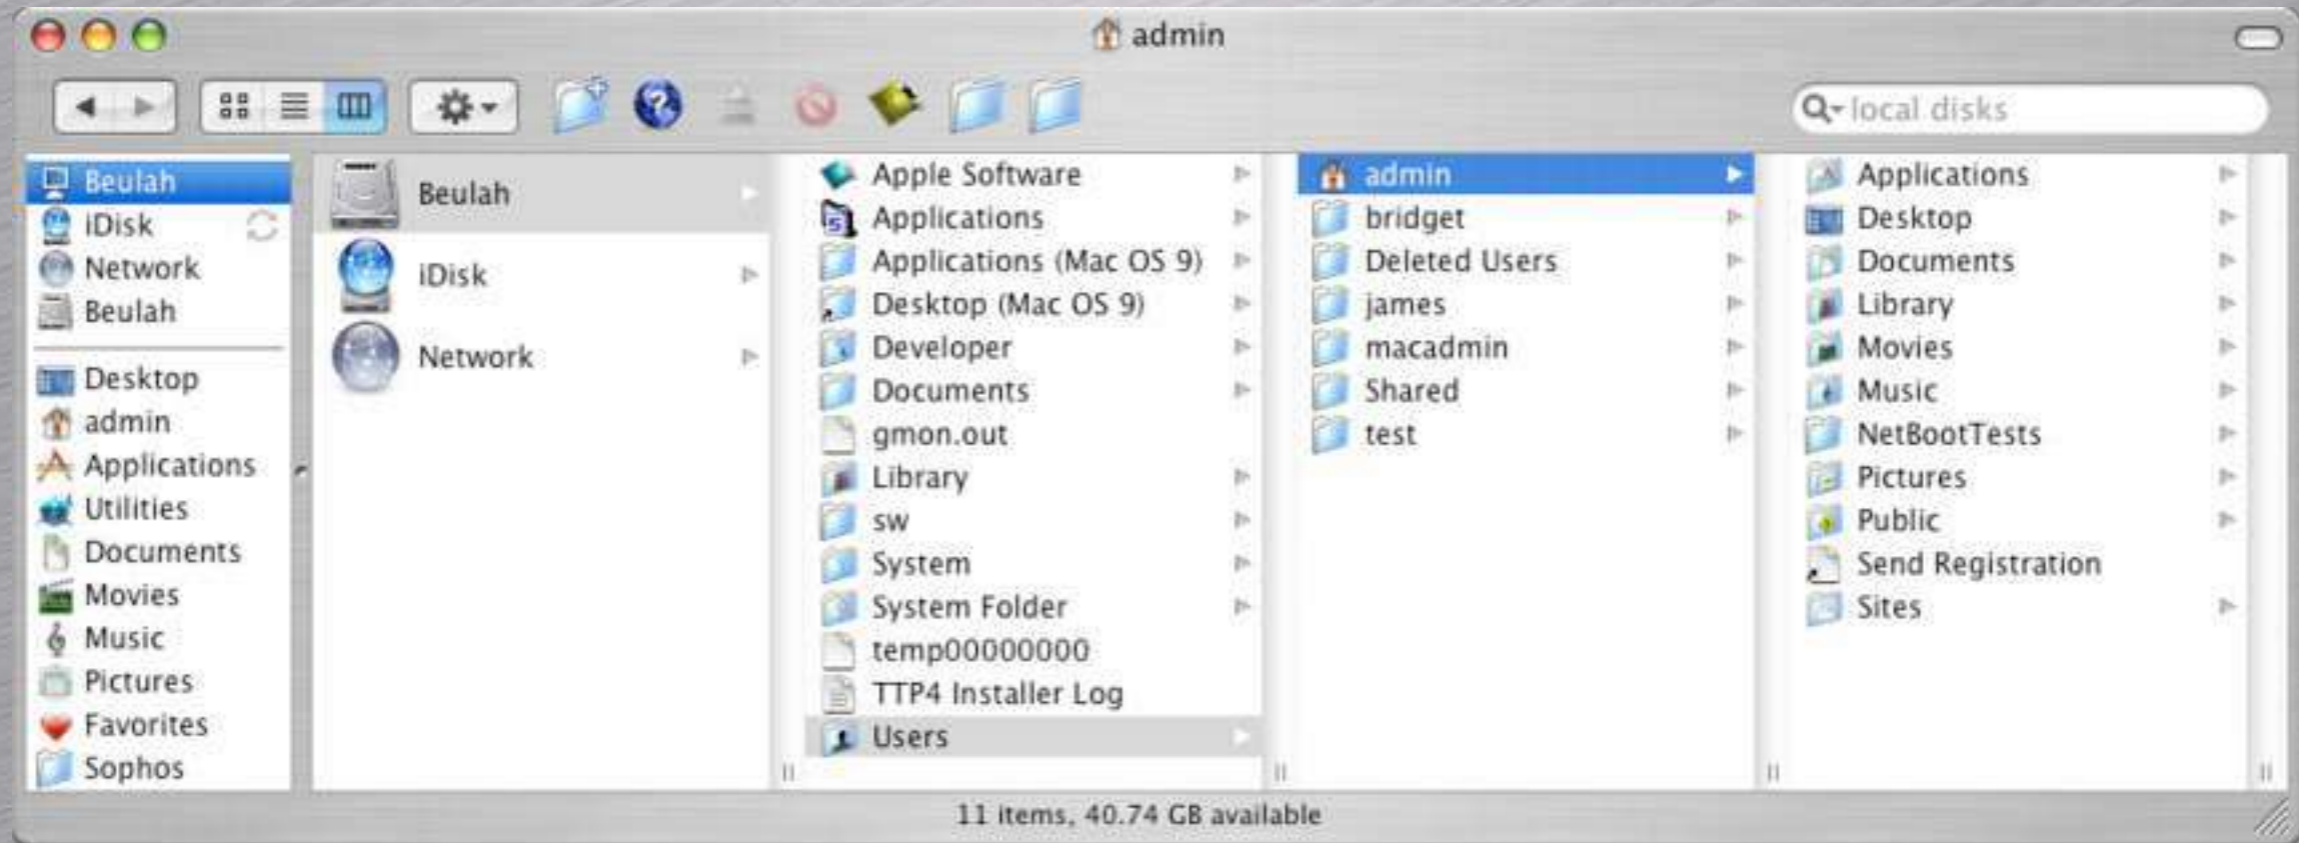

Usually catastrophic!

Other Folders...

- `/Applications (Mac OS 9)`
- `/Desktop (Mac OS 9)`
- `/System Folder`
- `/Developer`
- `/sw`

/Users

/Users (in terminal.app)

- Home file store is: `~/`
 - e.g., `~/Desktop`, `~/Documents`
- All users can access `/Users/Shared`
- Move files between accounts by using `/Users/[username]/Public/Drop Box`

3. Approaches to Troubleshooting

- What can go wrong?
 - Applications won't start, or crash, or won't shut down
 - Printing problems
 - Problems after Software Updates
 - Kernel panics
 - Mac won't start at all

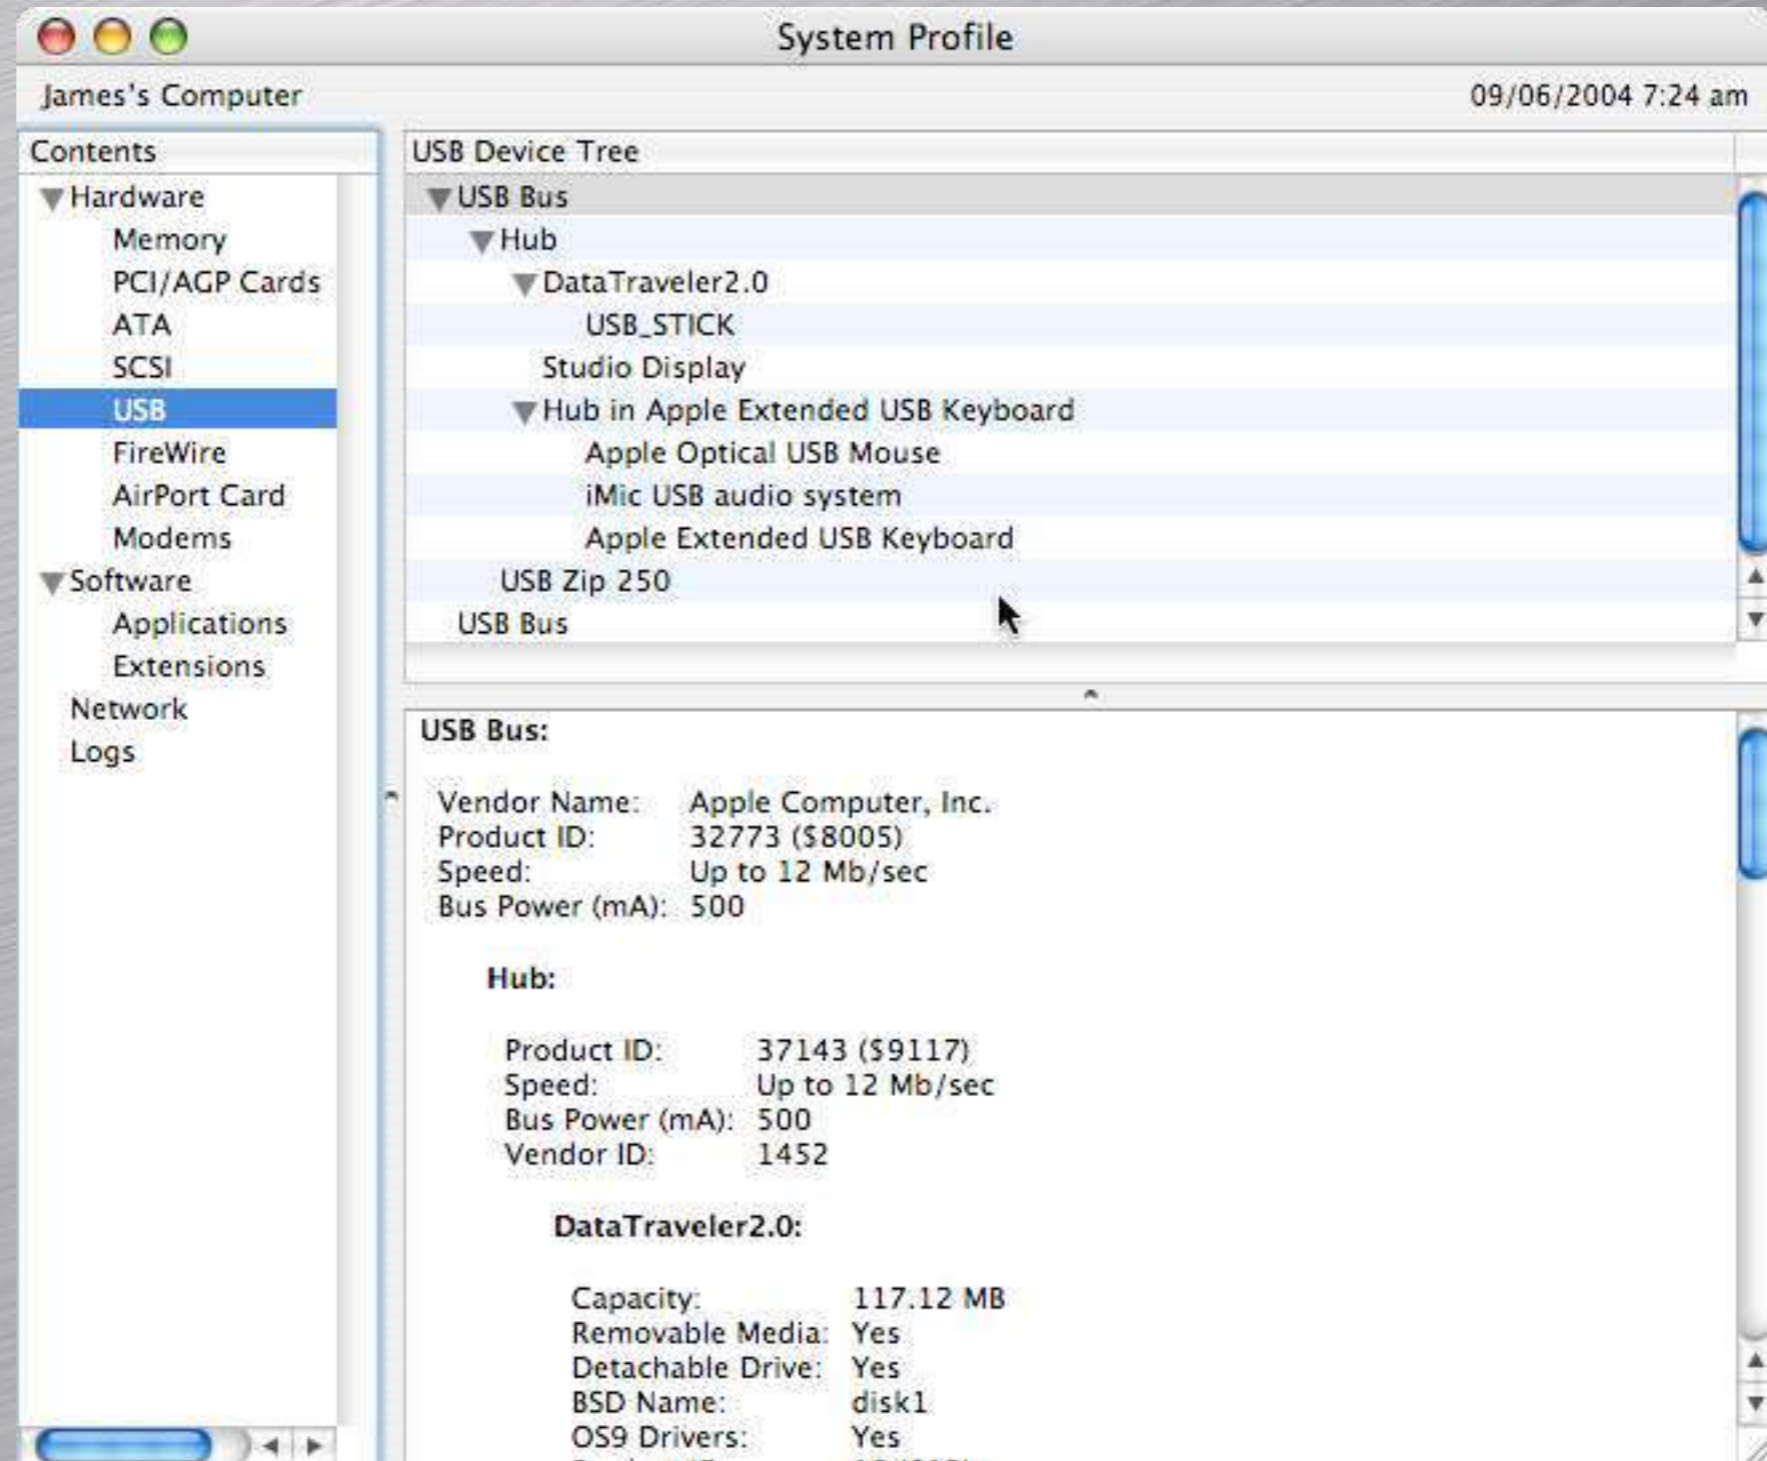

System Preferences

About this Mac / System Profile

On the  menu

The ⌘ and ⌥ keys

Command key ⌘ is actually the sign for something interesting in a Swedish campground

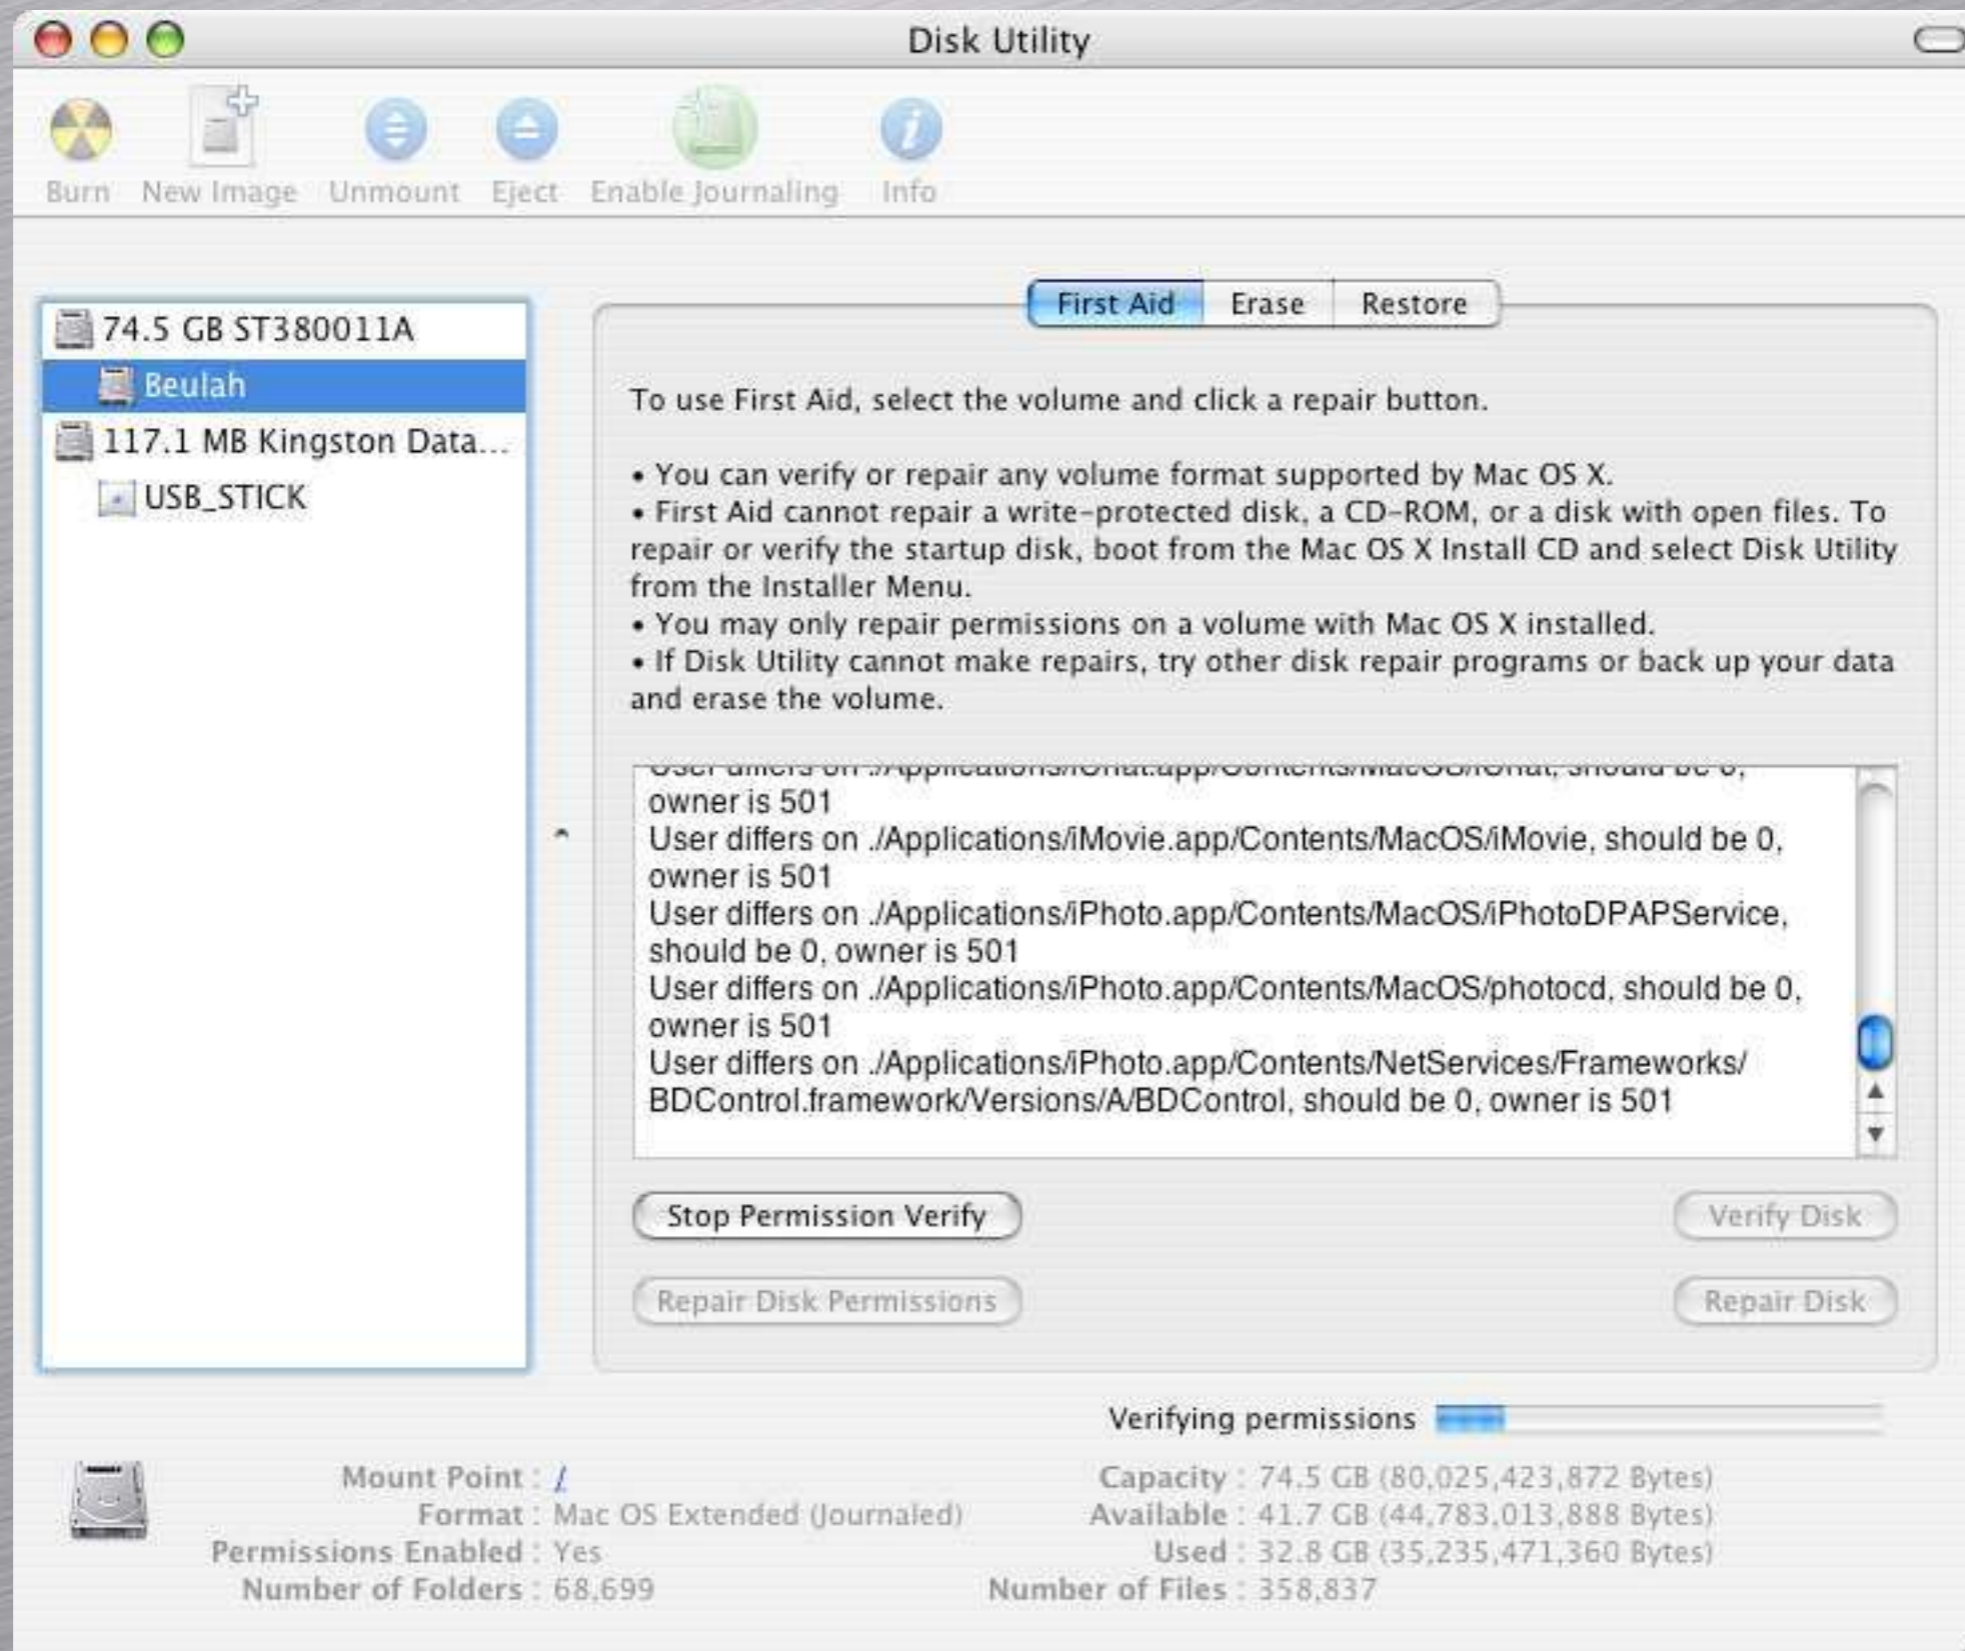

Option key ⌥ also has some interesting properties

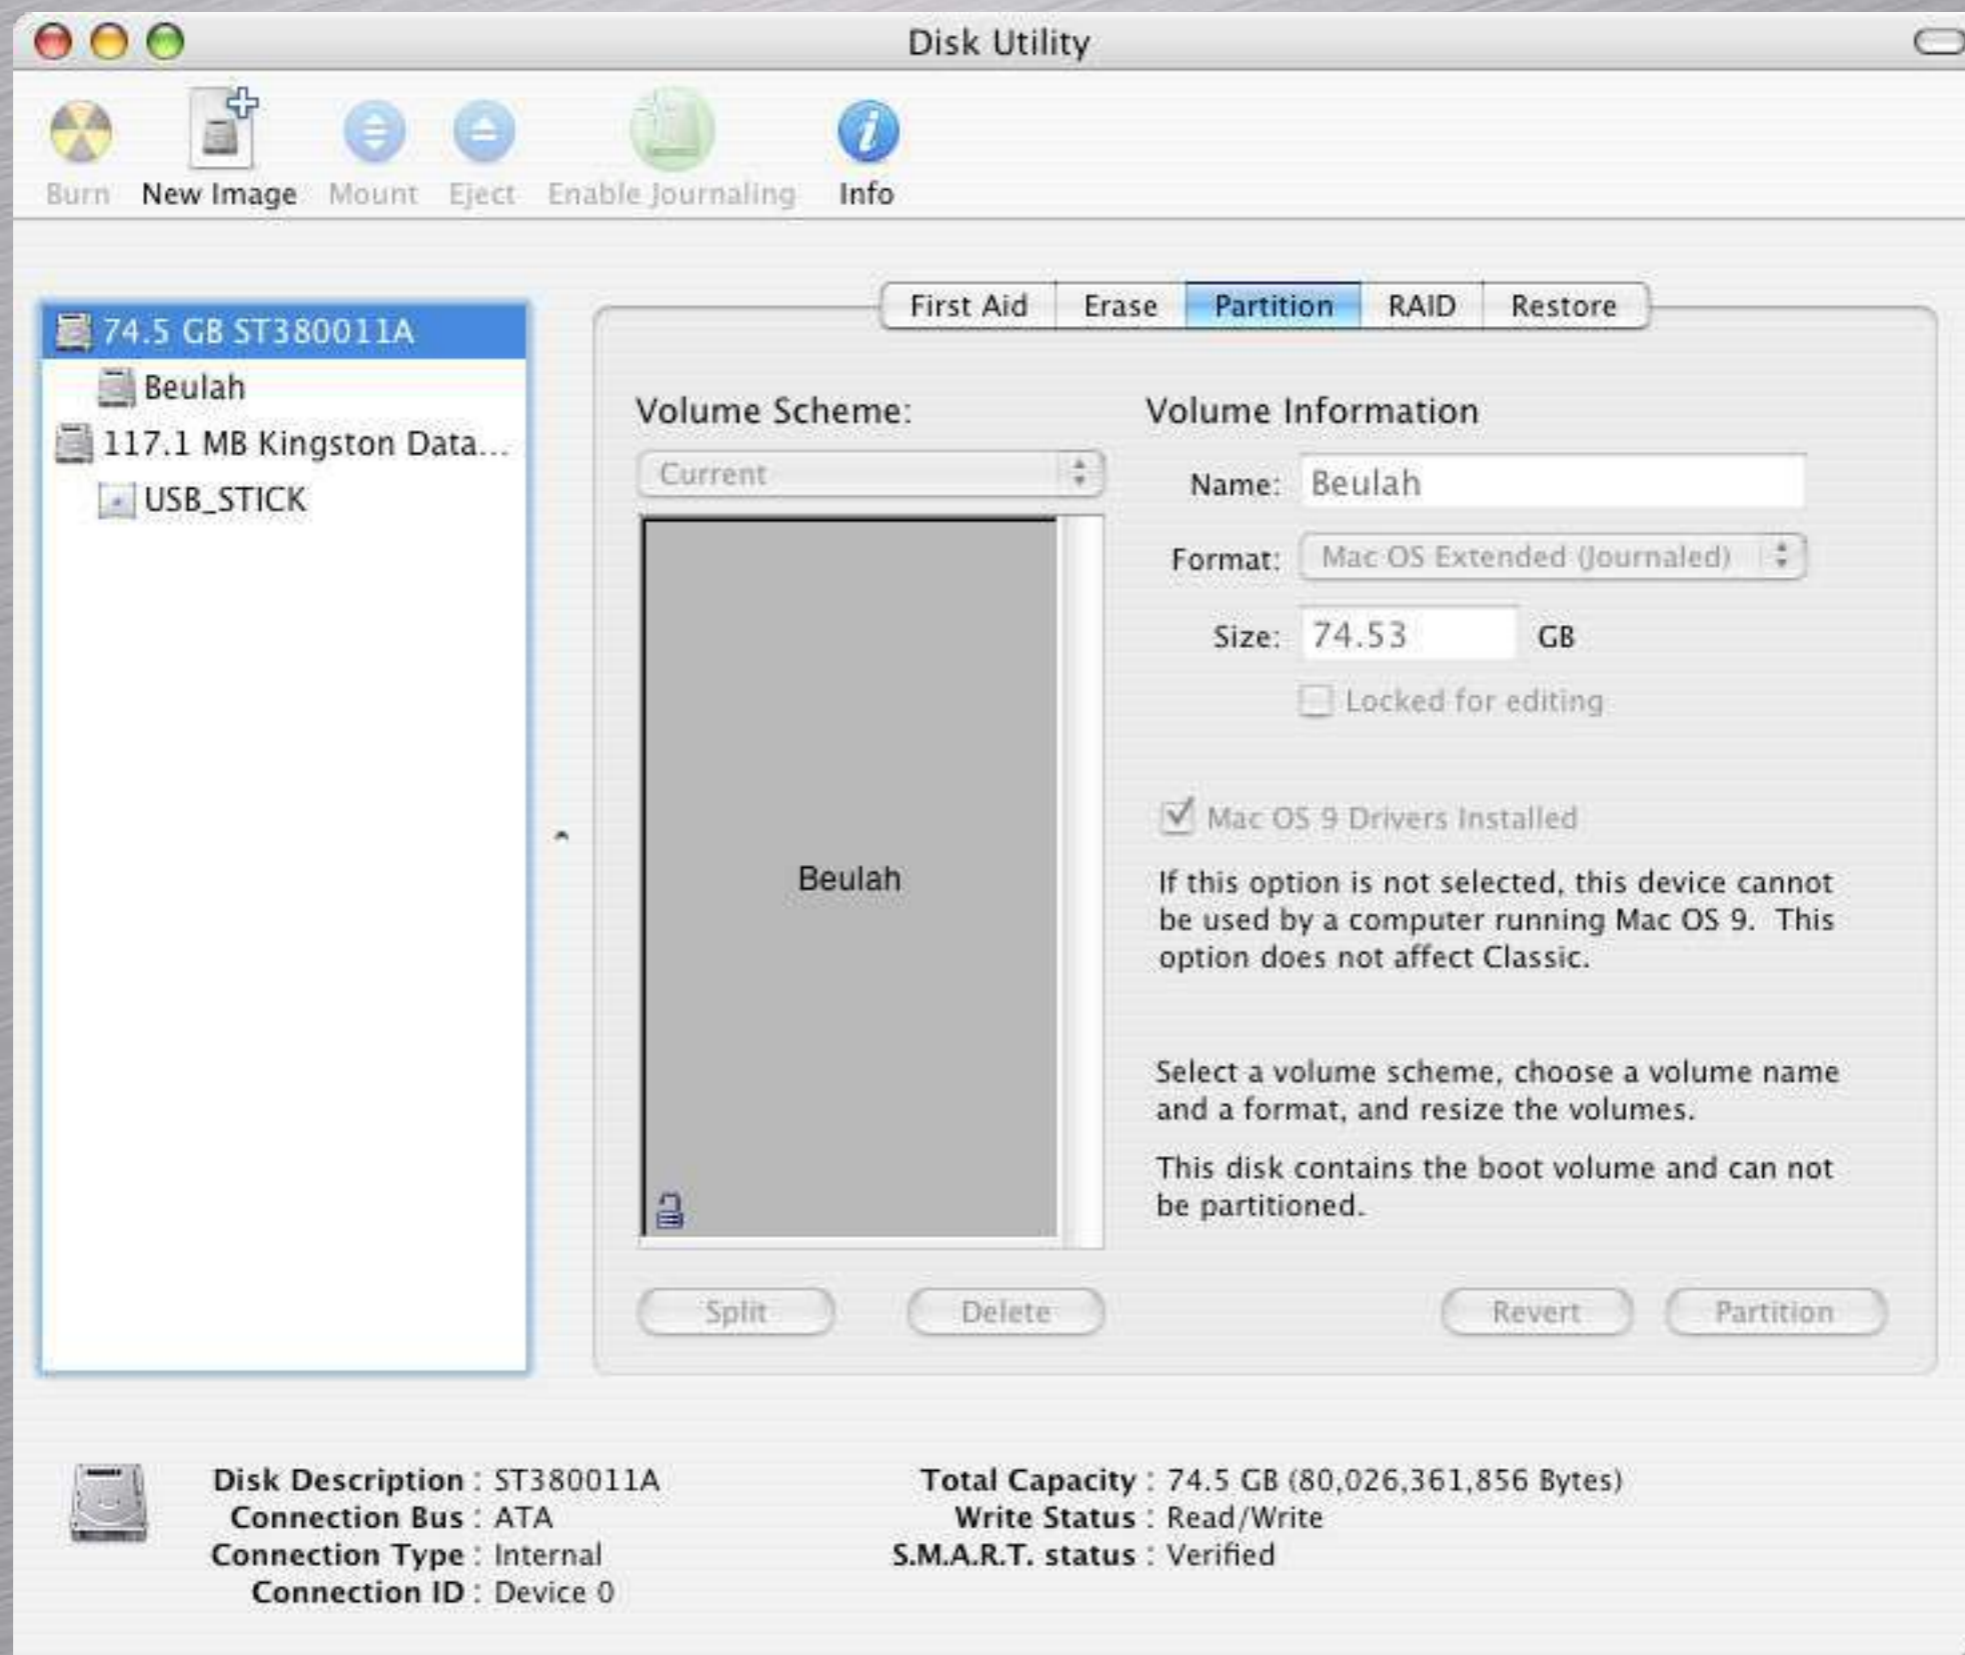

Hold it down when looking at application menus (e.g., Finder / File) and see what happens

Troubleshooting Applications

- What to check:
 - Disk permissions
 - Web-based resources
 - Log files (Console.app)
 - .plist files in `/user/Library/Preferences`

Disk Utility is in */Applications/Utilities*
or in terminal.app: `sudo diskutil repairPermissions /`

run: `man diskutil` in terminal.app for more info.

Disk Permissions (cont'd)

For most permission troubleshooting, **Get info** is good enough: ⌘-i

Padlock icon means that permissions are locked and you can't change them without authenticating.

Disk Permissions (cont'd)

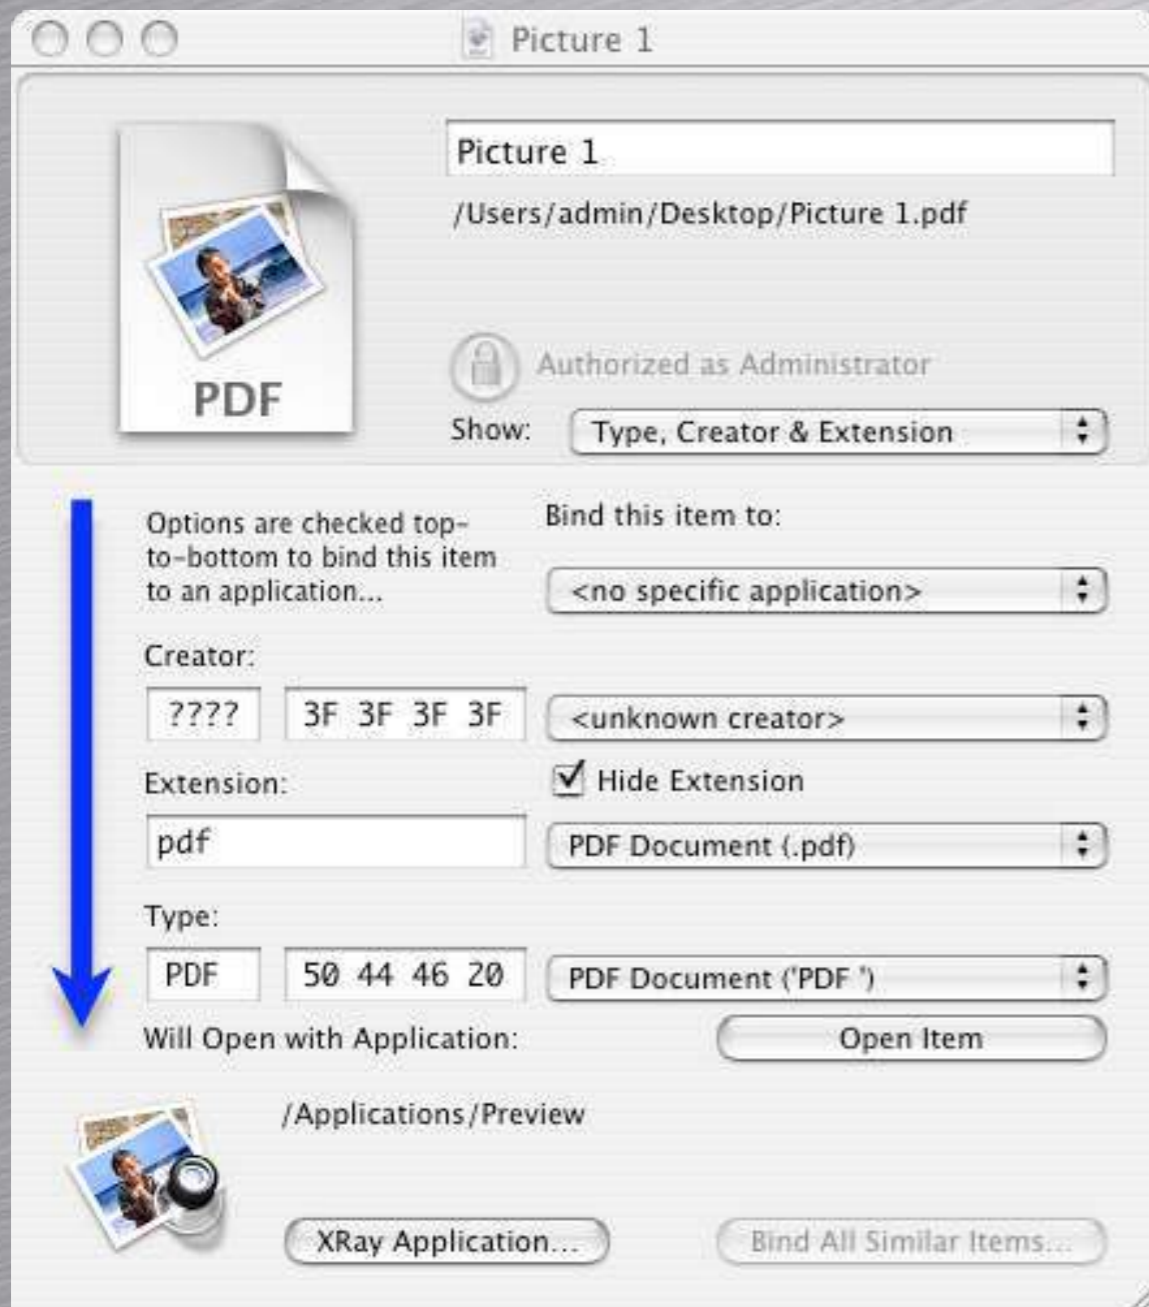

OK, that's better. Now you can really break things (if you don't know what you're doing).

Disk Permissions (for experts)

If you want an advanced GUI, use XRAY

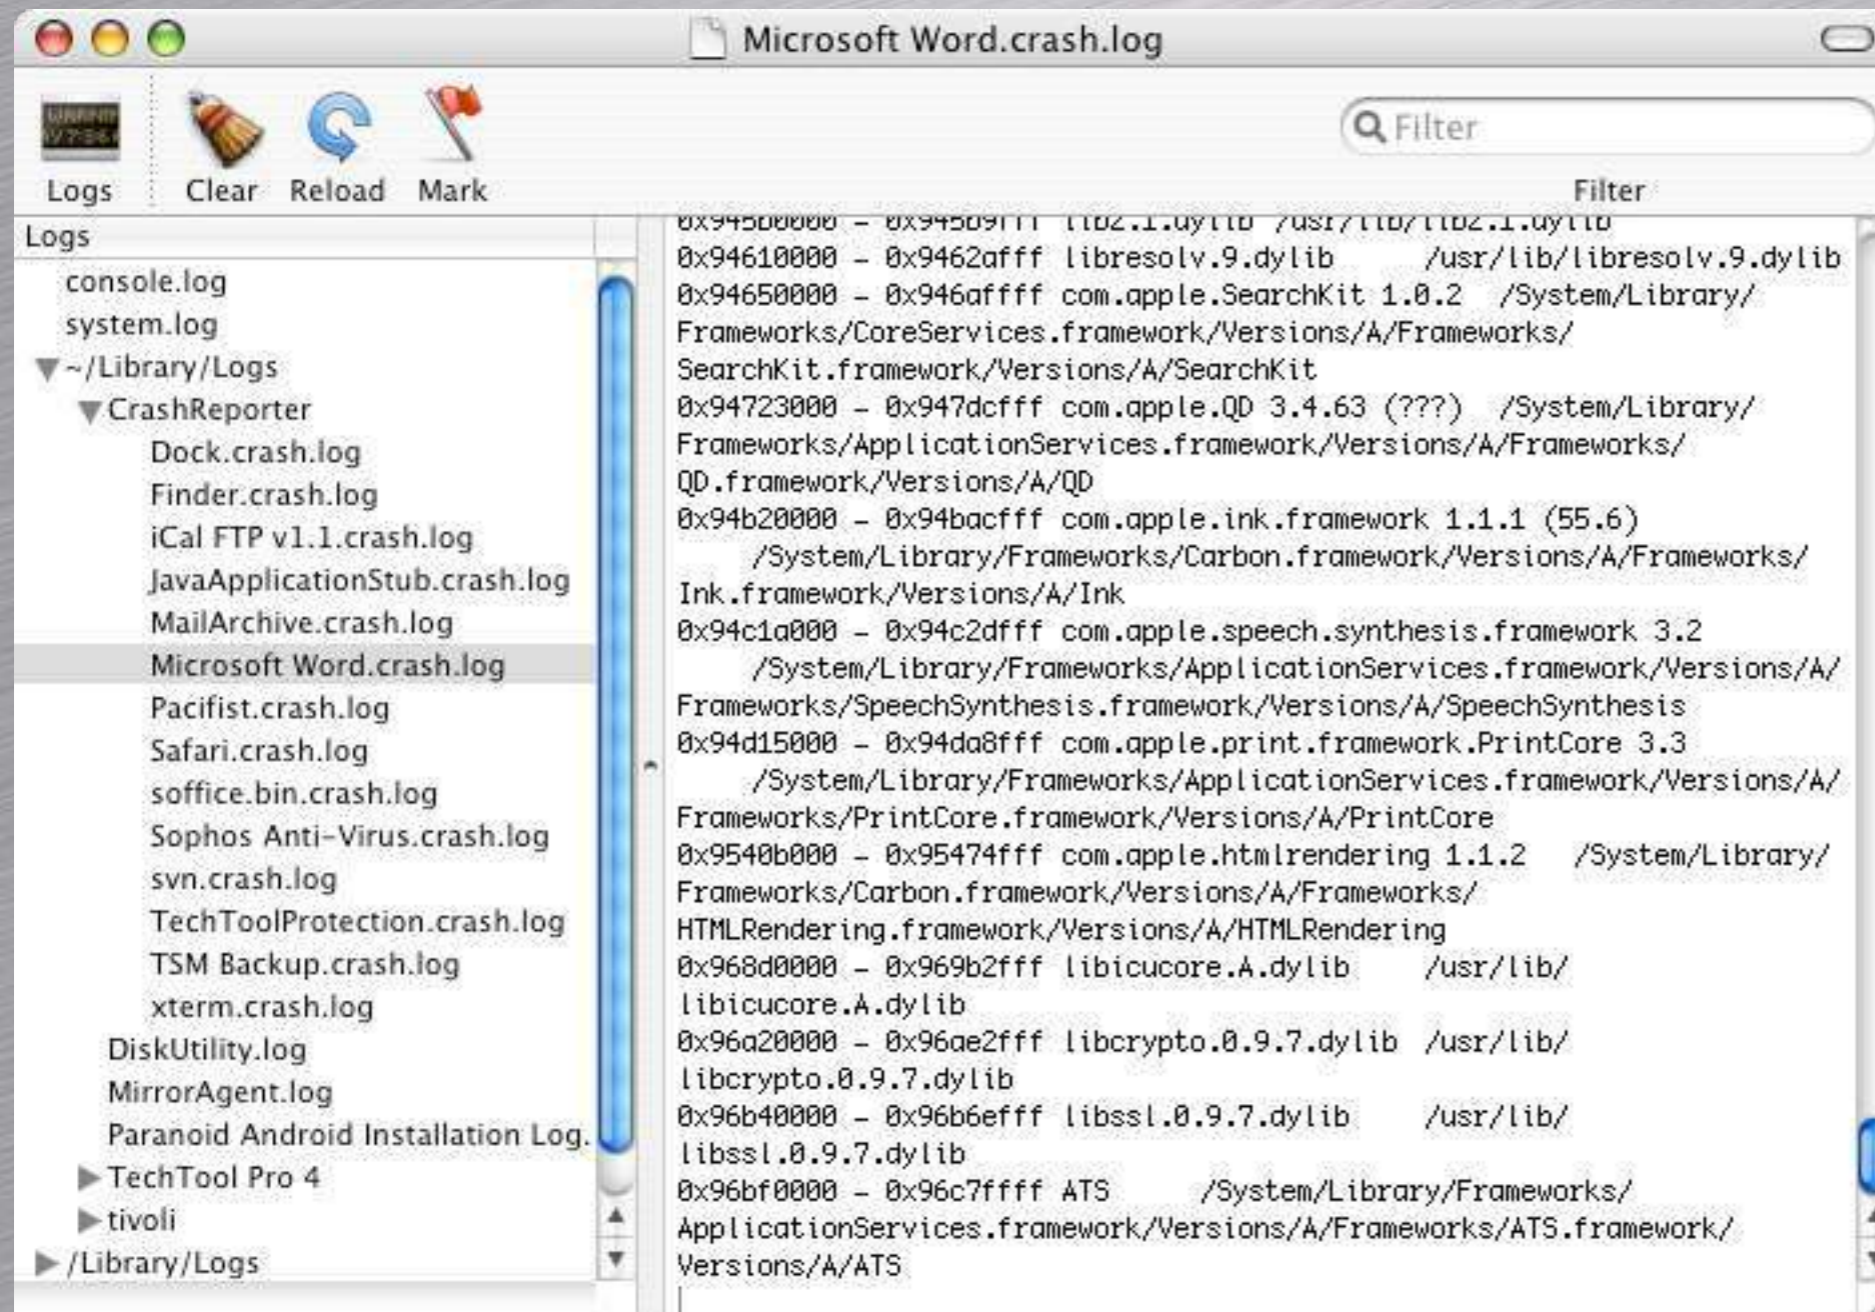

(<http://www.brockhoff.net/xray/index.html>) - \$10 Shareware

MacInTouch http://www.macintouch.com/	

Log Files (console.app)

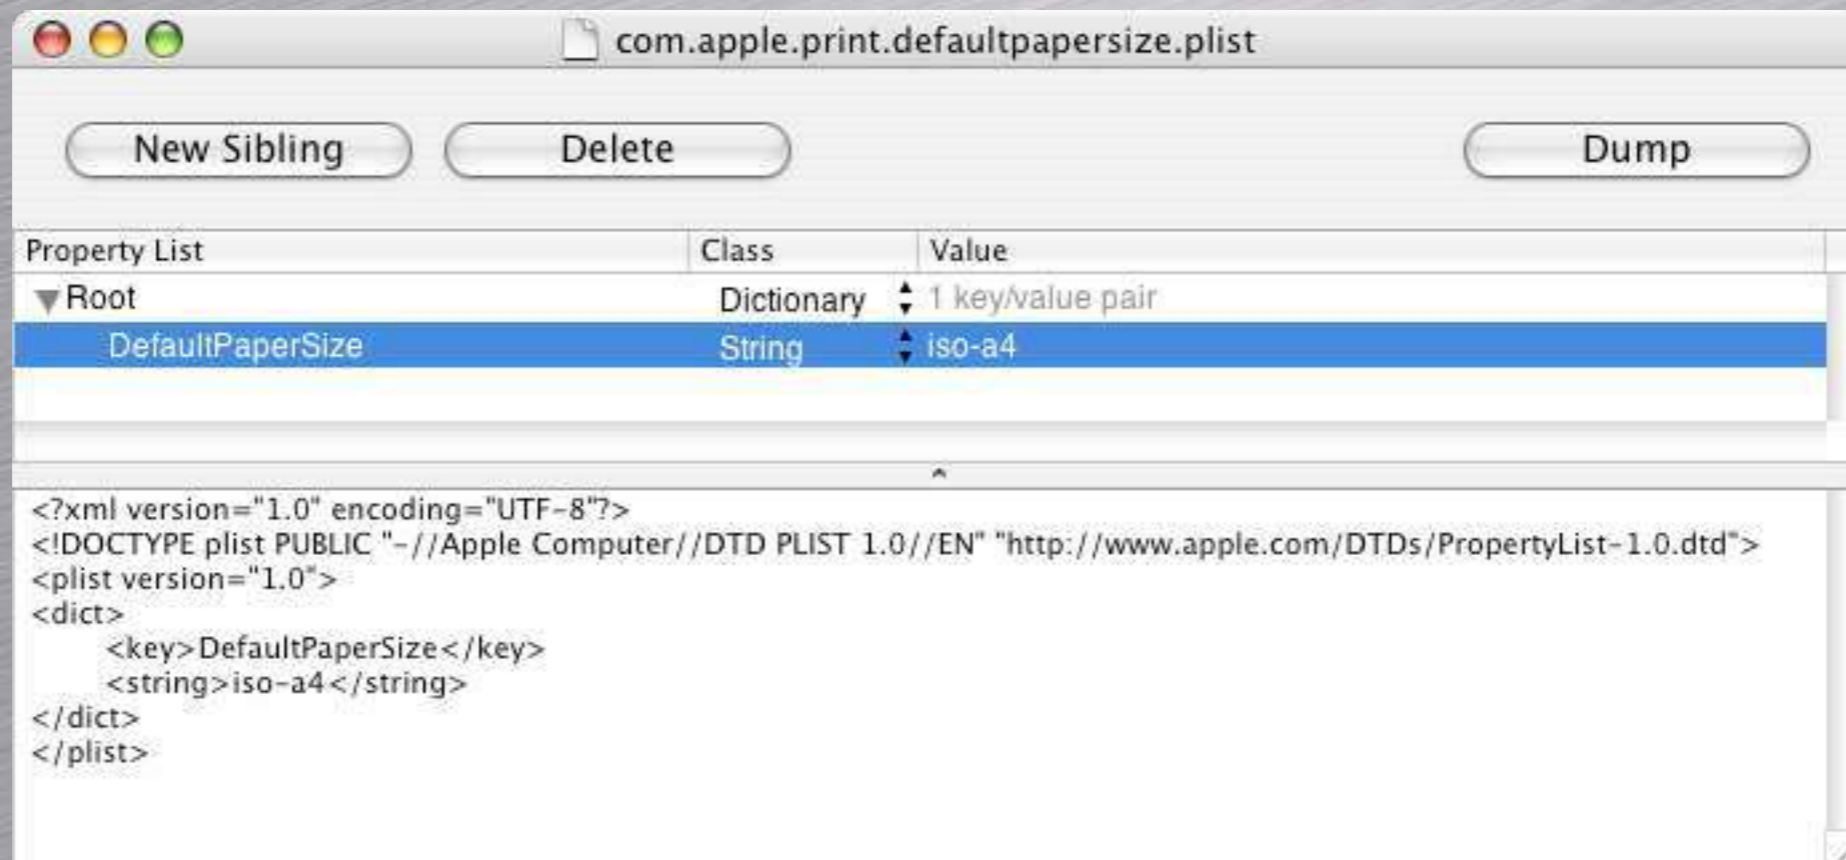

Safari bug reporter

This won't help most people, but can be submitted to Apple for recurrent problems

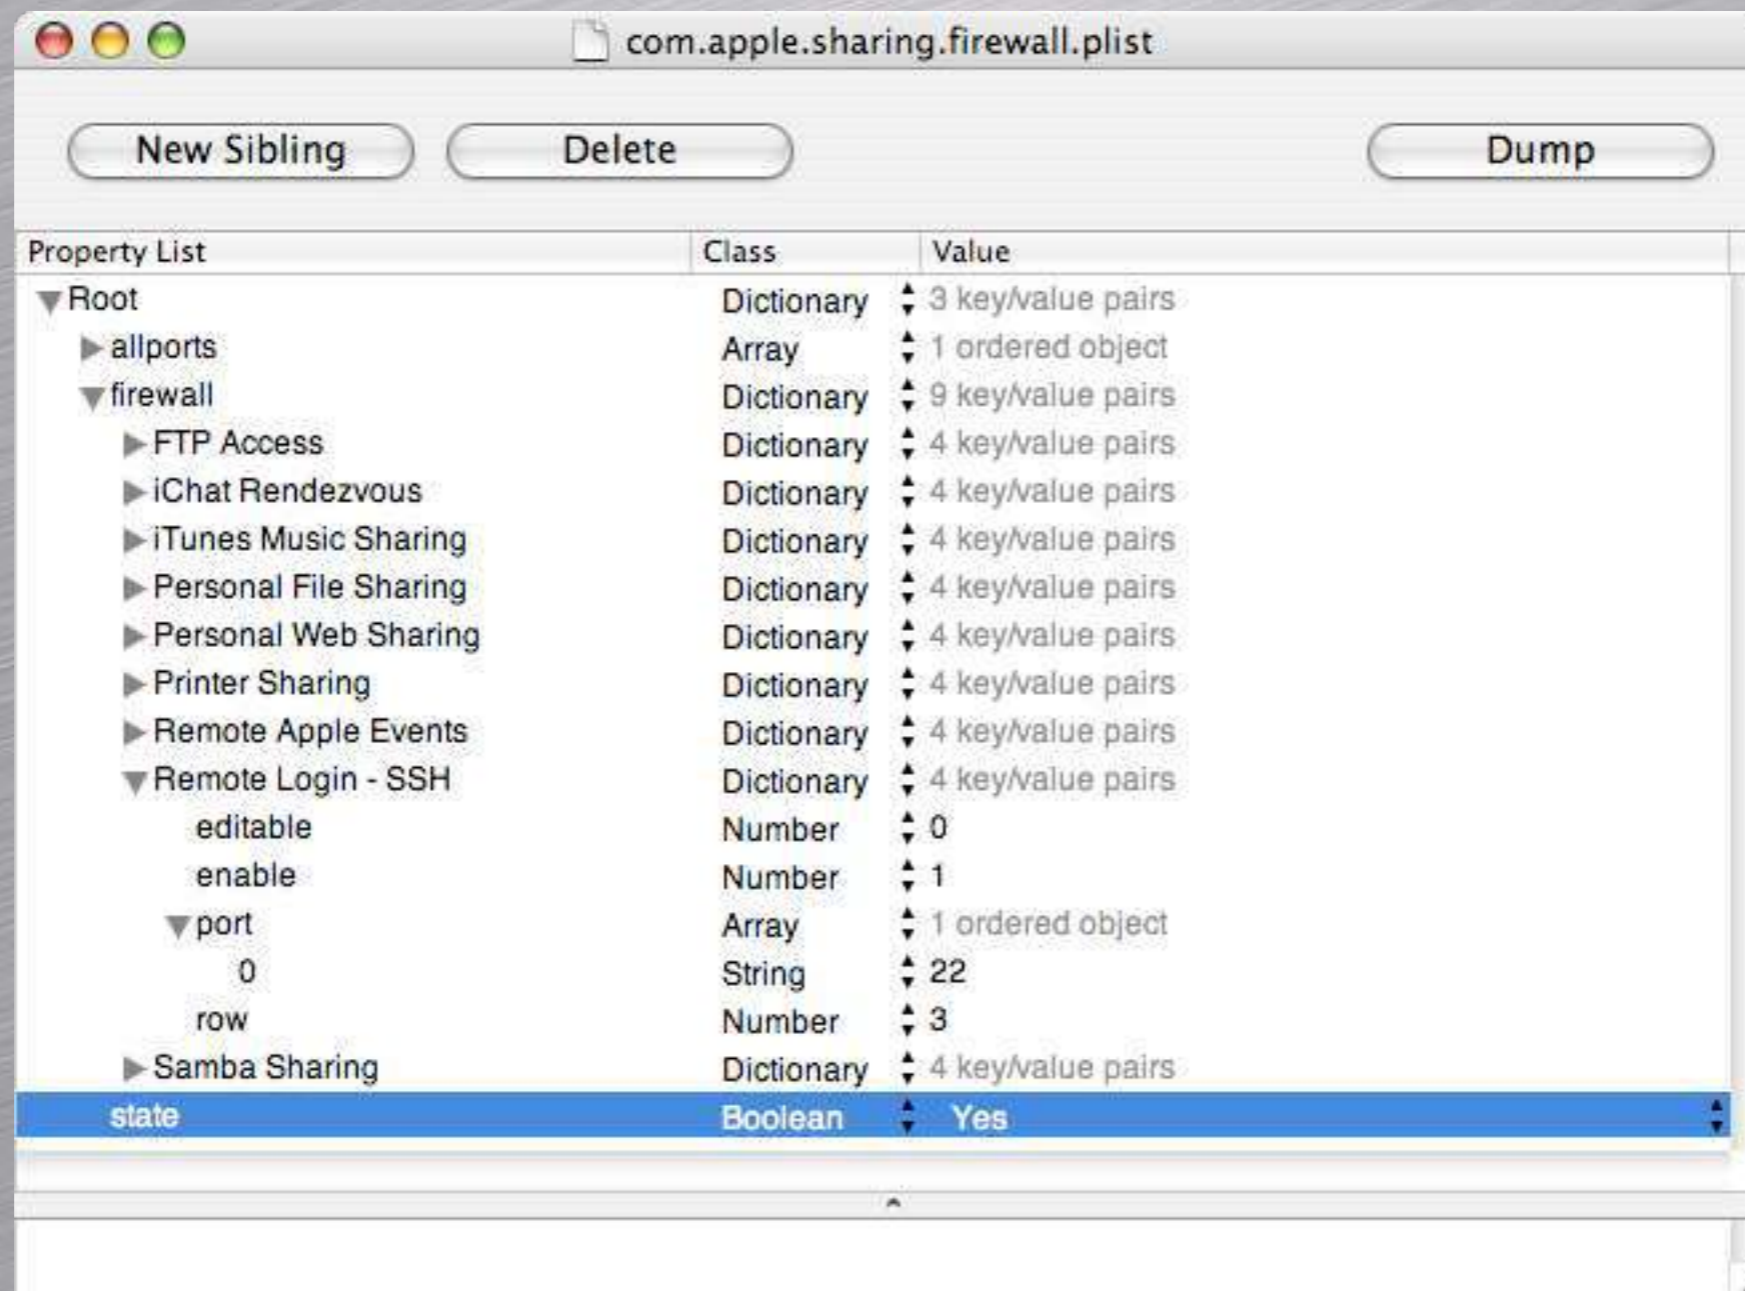

.plist files (~/.Library/Preferences)

- .plist files are XML files containing all User or Application preferences. Think of them as configuration files
- User-defined .plist files in ~/.Library/Preferences can be deleted or edited fairly safely
- can be read (e.g., `defaults read -app Safari`) or edited (e.g., `defaults write com.apple.Safari IncludeDebugMenu 1`) in terminal.app. See `man defaults` for more info.

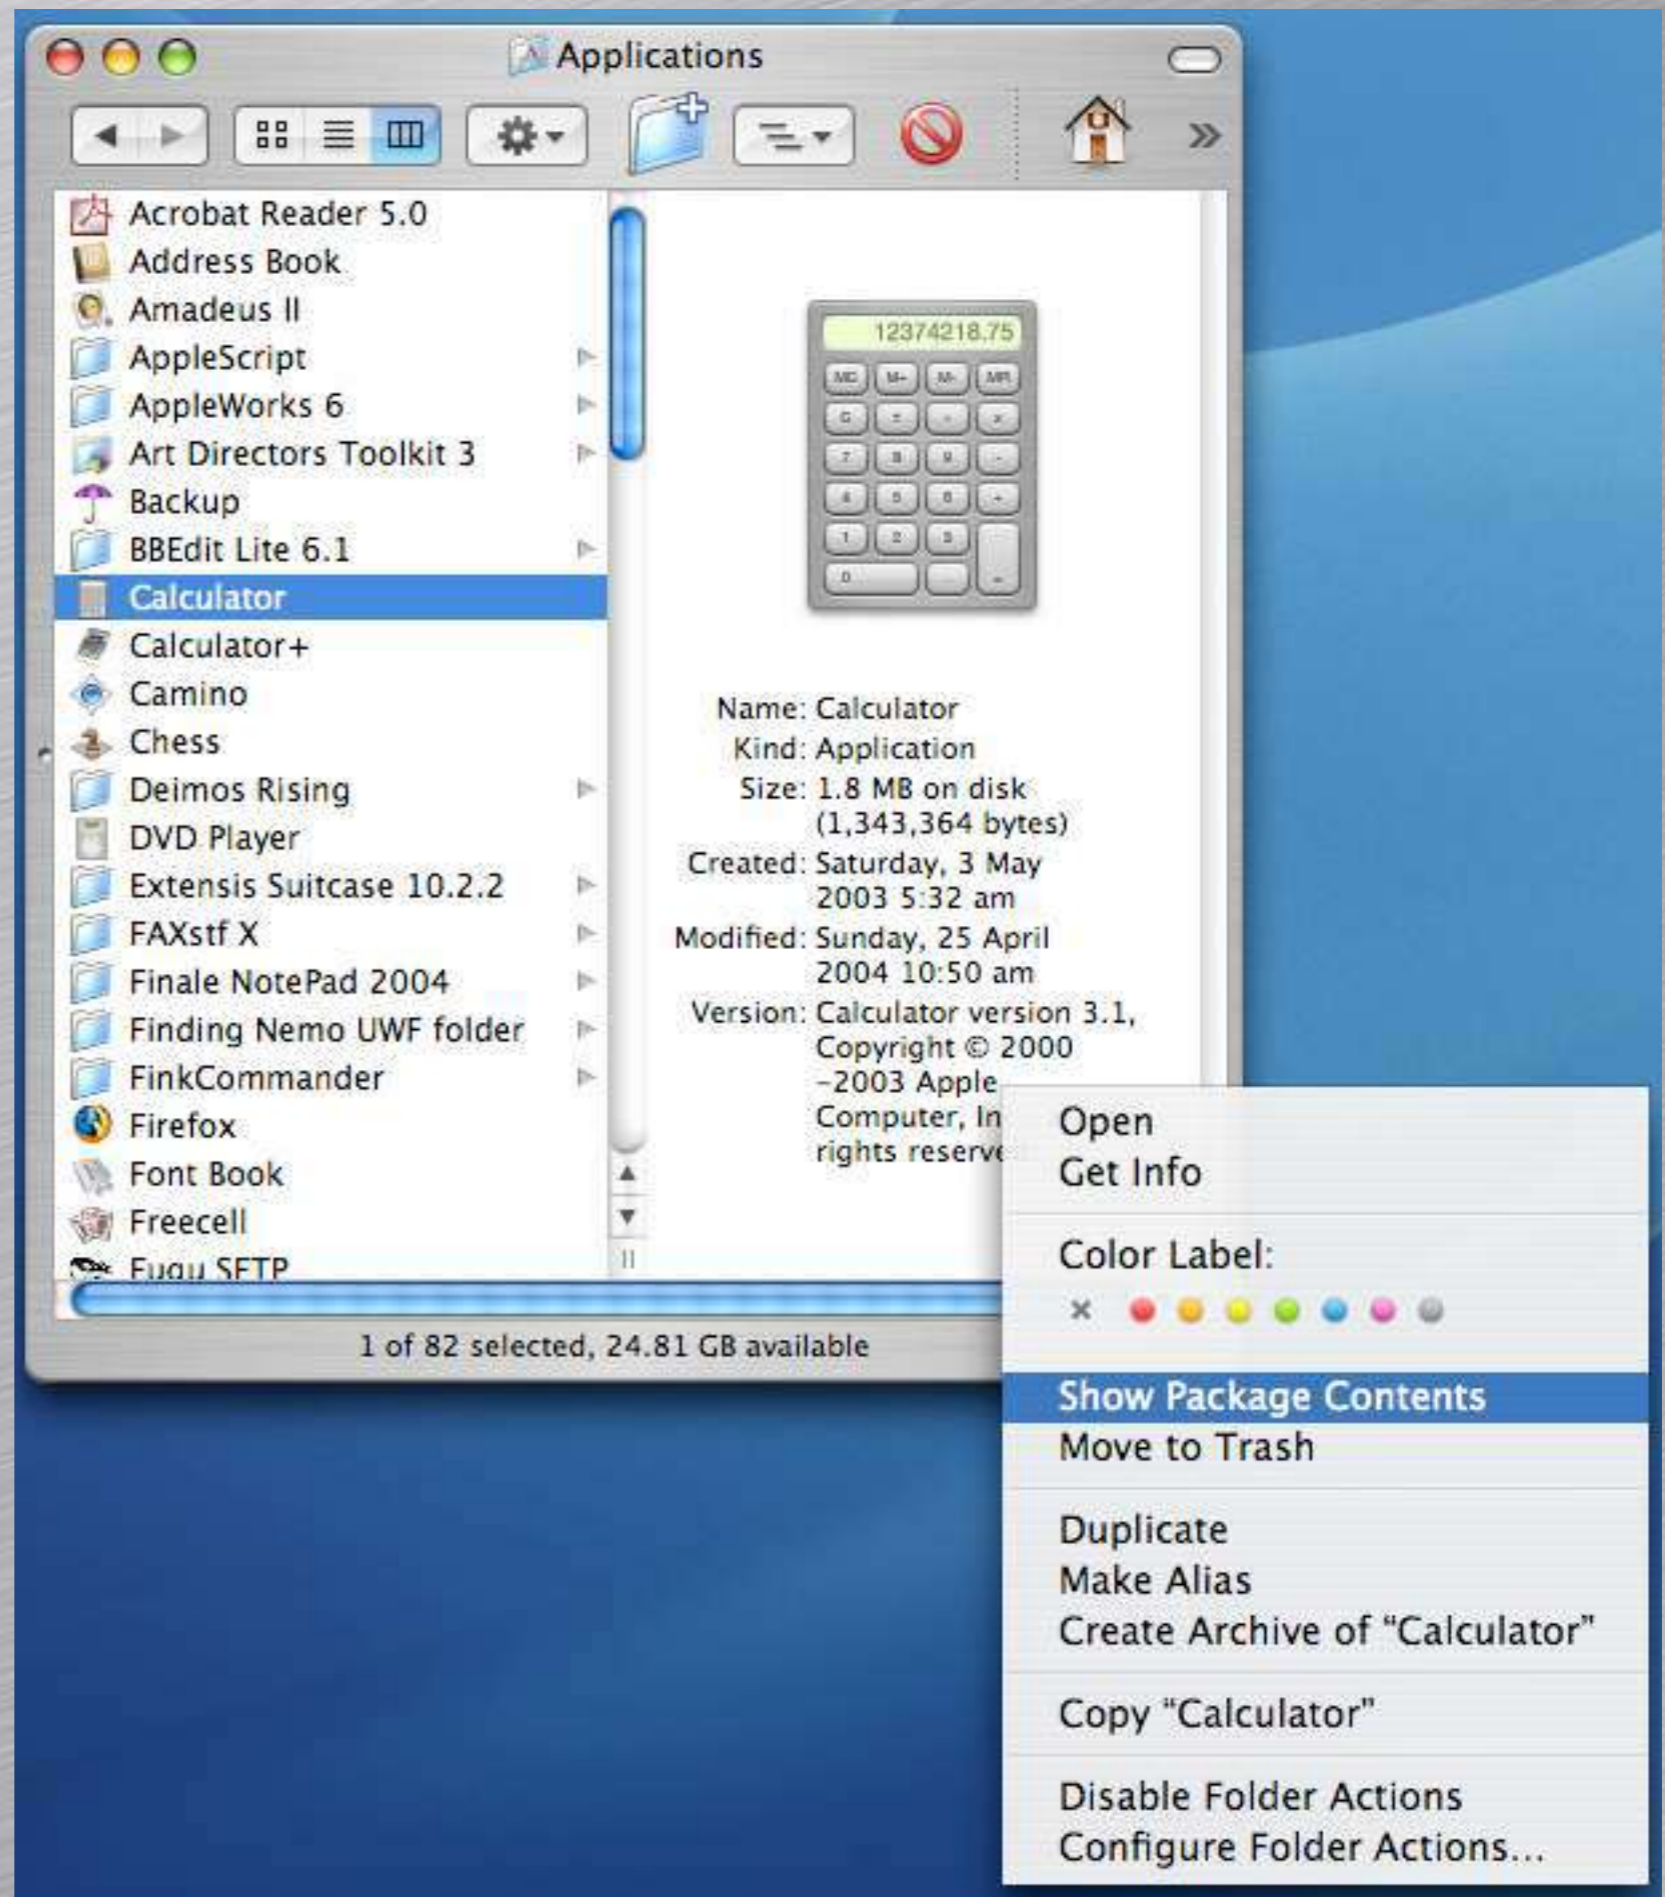

.plist files (/Library/Preferences)

- These will override preference files in ~/Library/Preferences if the same (Sophos when installing from CID)
- Can be edited but be more cautious

More about apps

- Many OS X apps are, more correctly, application *bundles* or *packages*
- Bundle contents can be seen by **control-click** on app name, then selecting 'Show Package Contents'

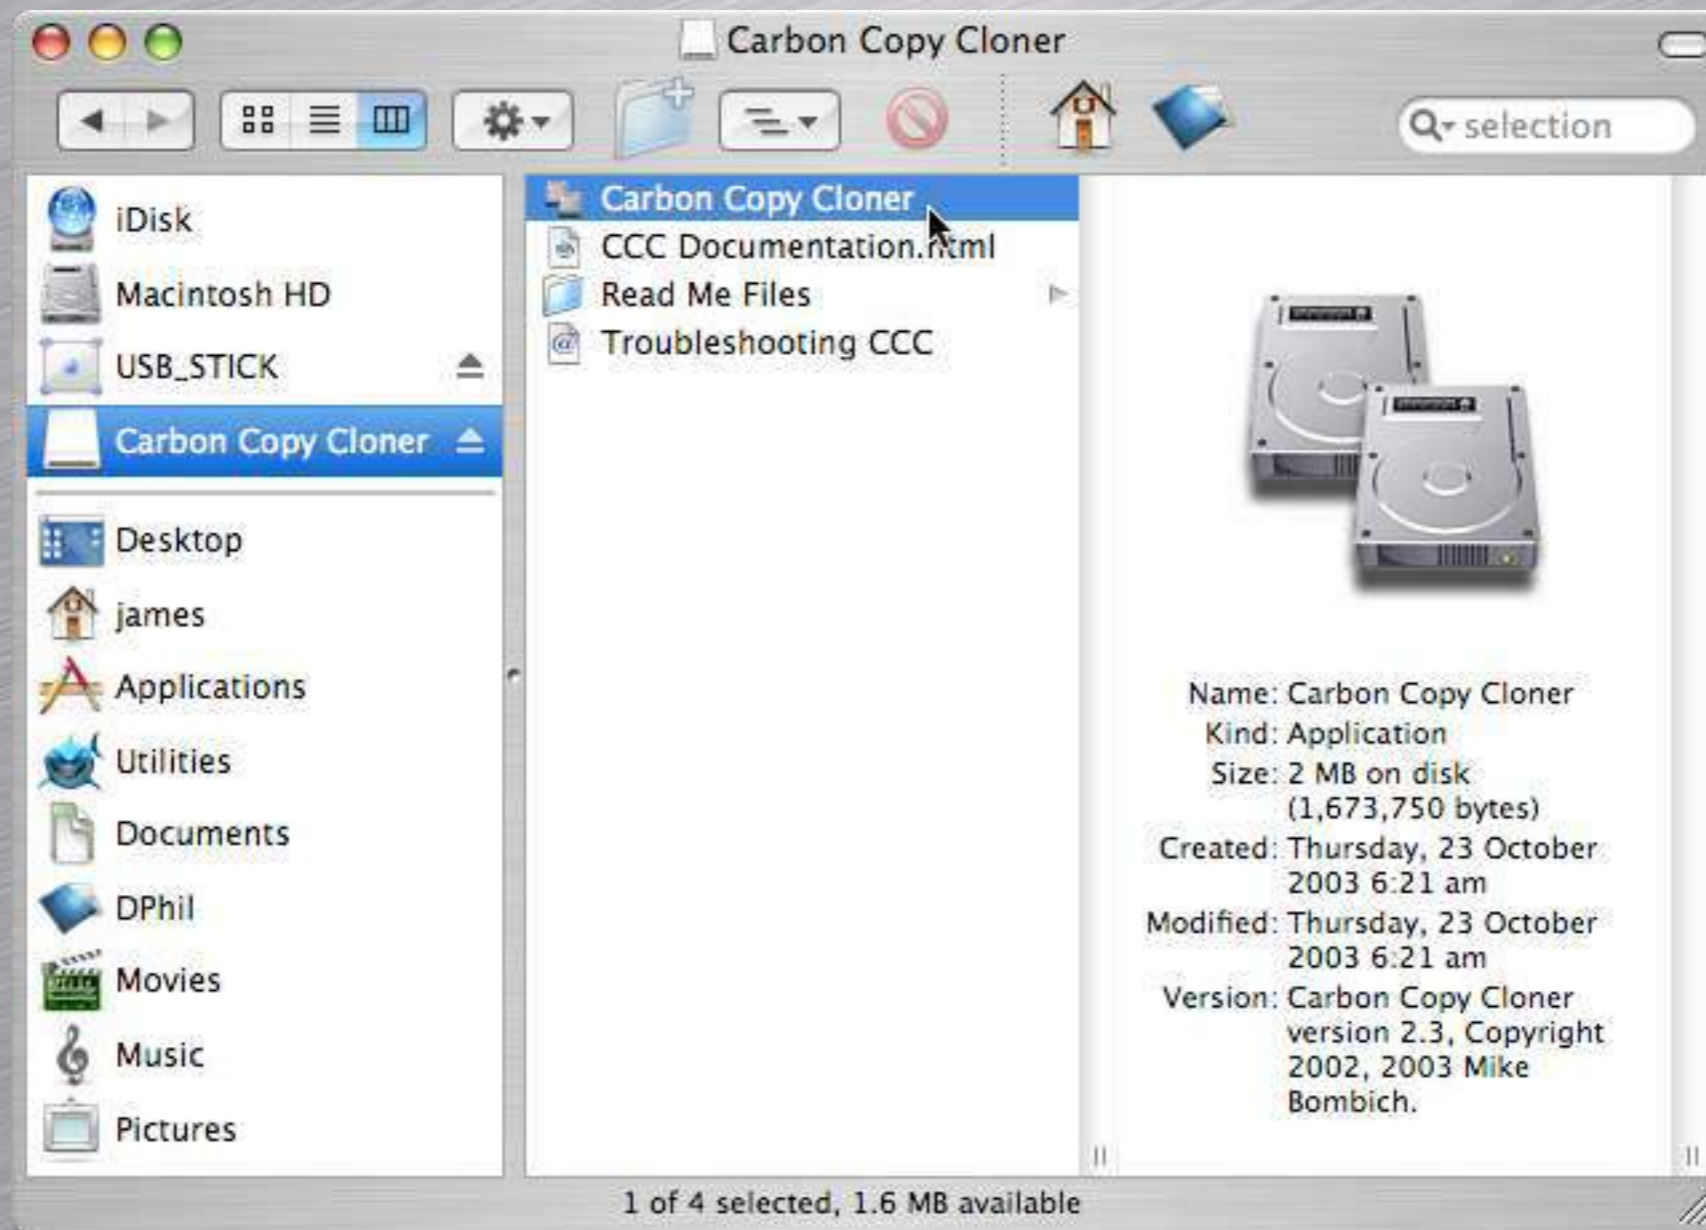

Yet more about apps

Apps are often distributed as **disk image** (.dmg) files: these mount on the desktop when run and are then like any other volume. Are also distributed compressed with GZip or BZip:

Firefox-0.8-mac.dmg.gz (9.4 Mb)

Firefox-0.8-mac.dmg (30.5 Mb)

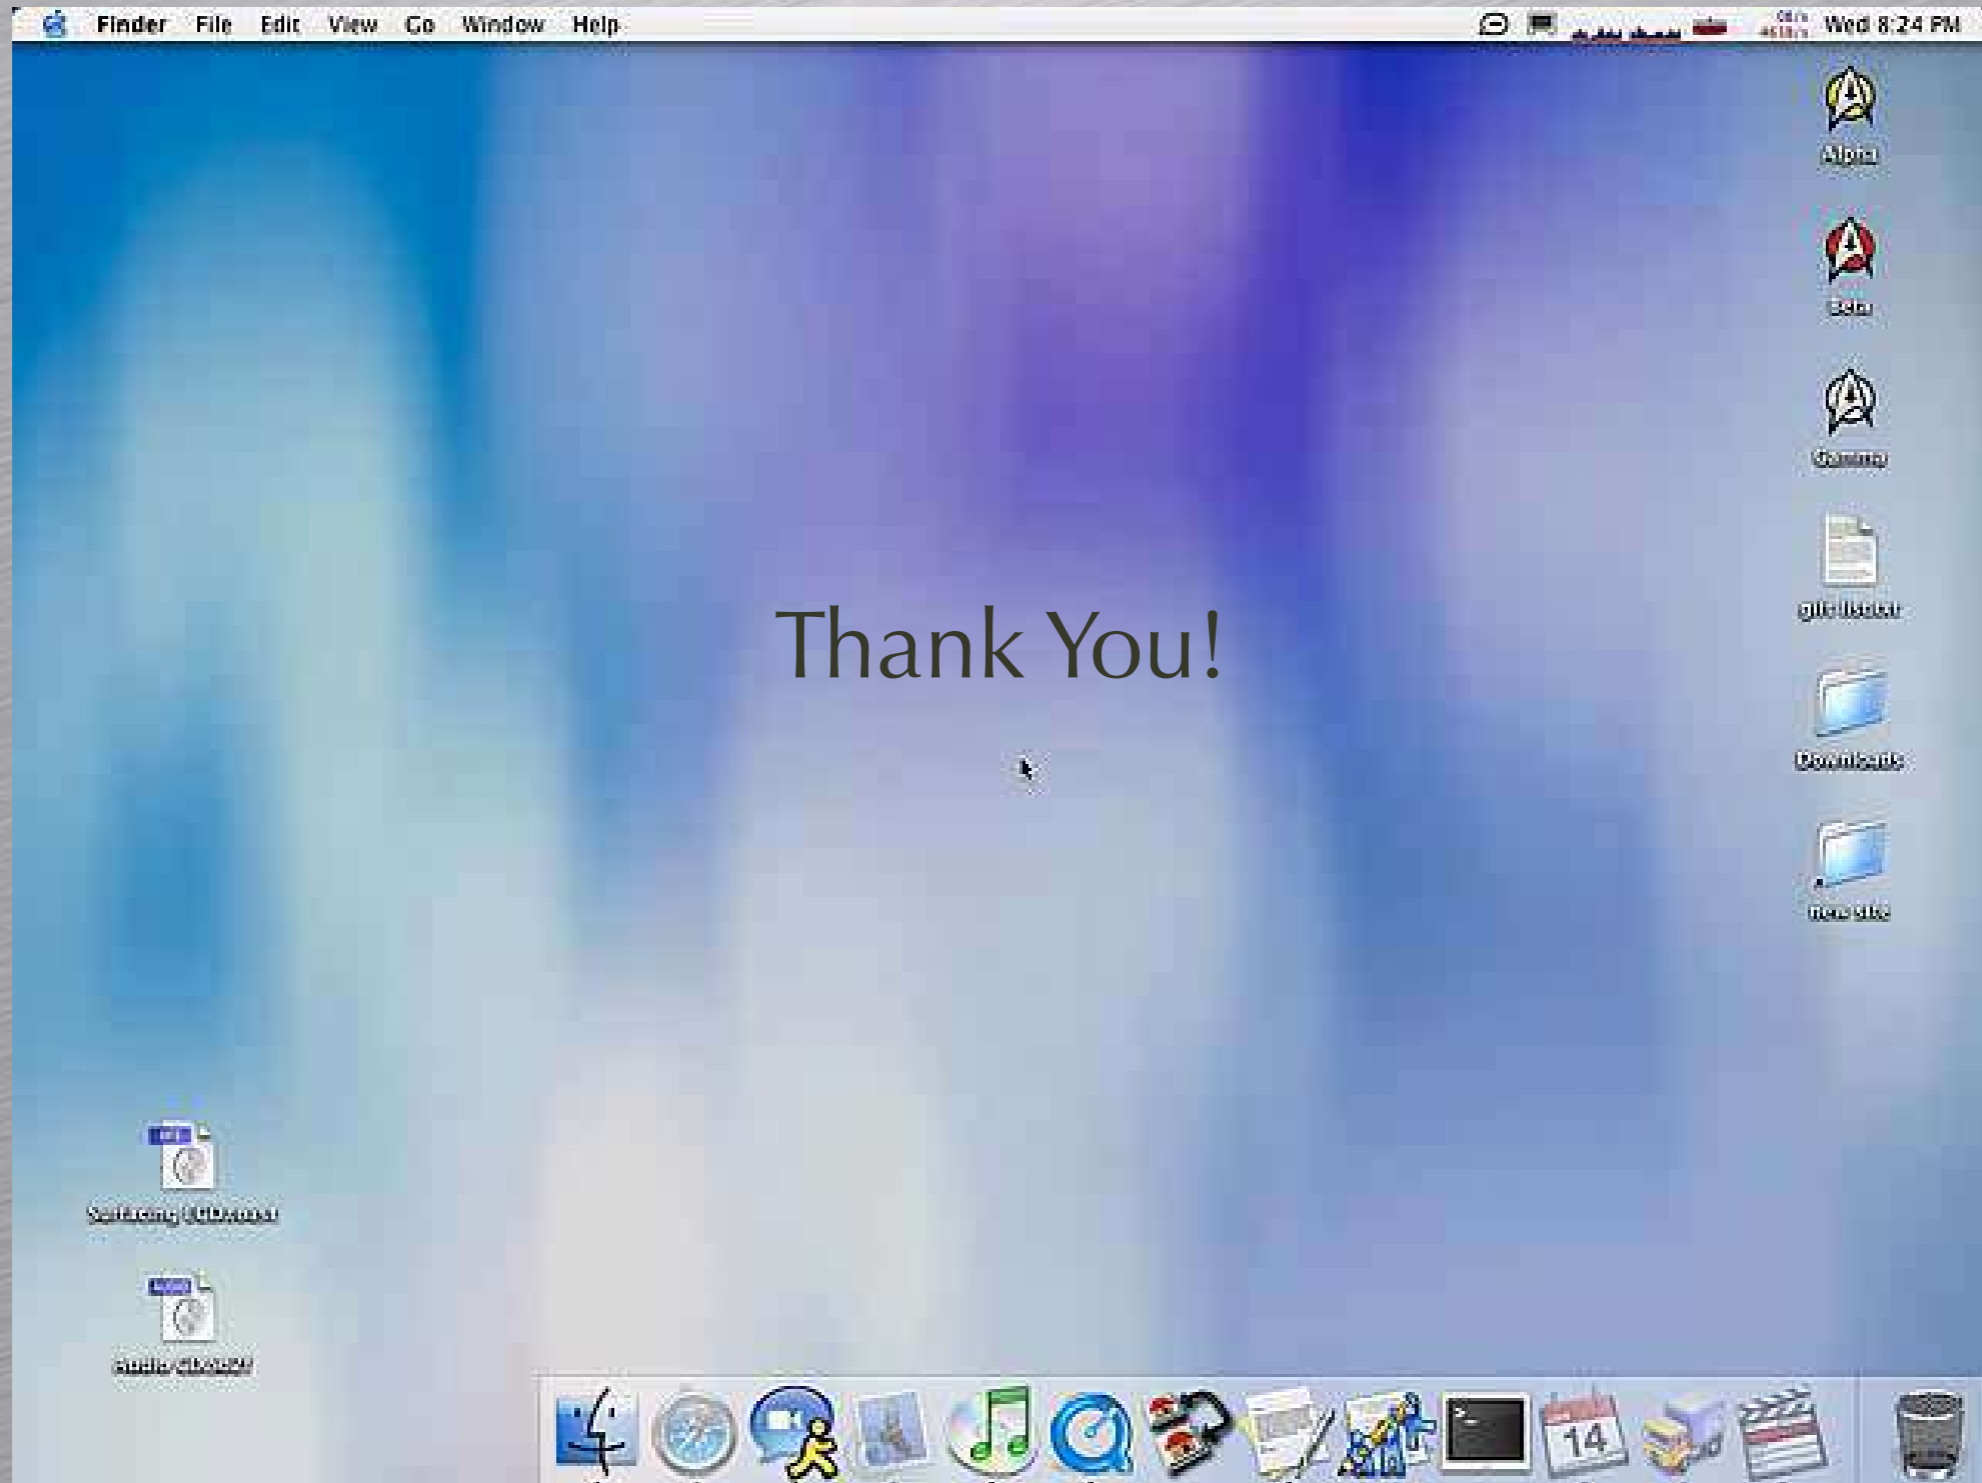

Other formats:

- .pkg & .mpkg (OS X Installer Packages)
- .gz (Gzip compressed - .tar.gz, .dmg.gz also common)
- .zip (Zip archive)
- .bz2 (Bzip2 compressed)
- .smi (Self-mounting image)
- .sit (Stuff-it archive)
- .hqx (Bin-Hex encoded file)

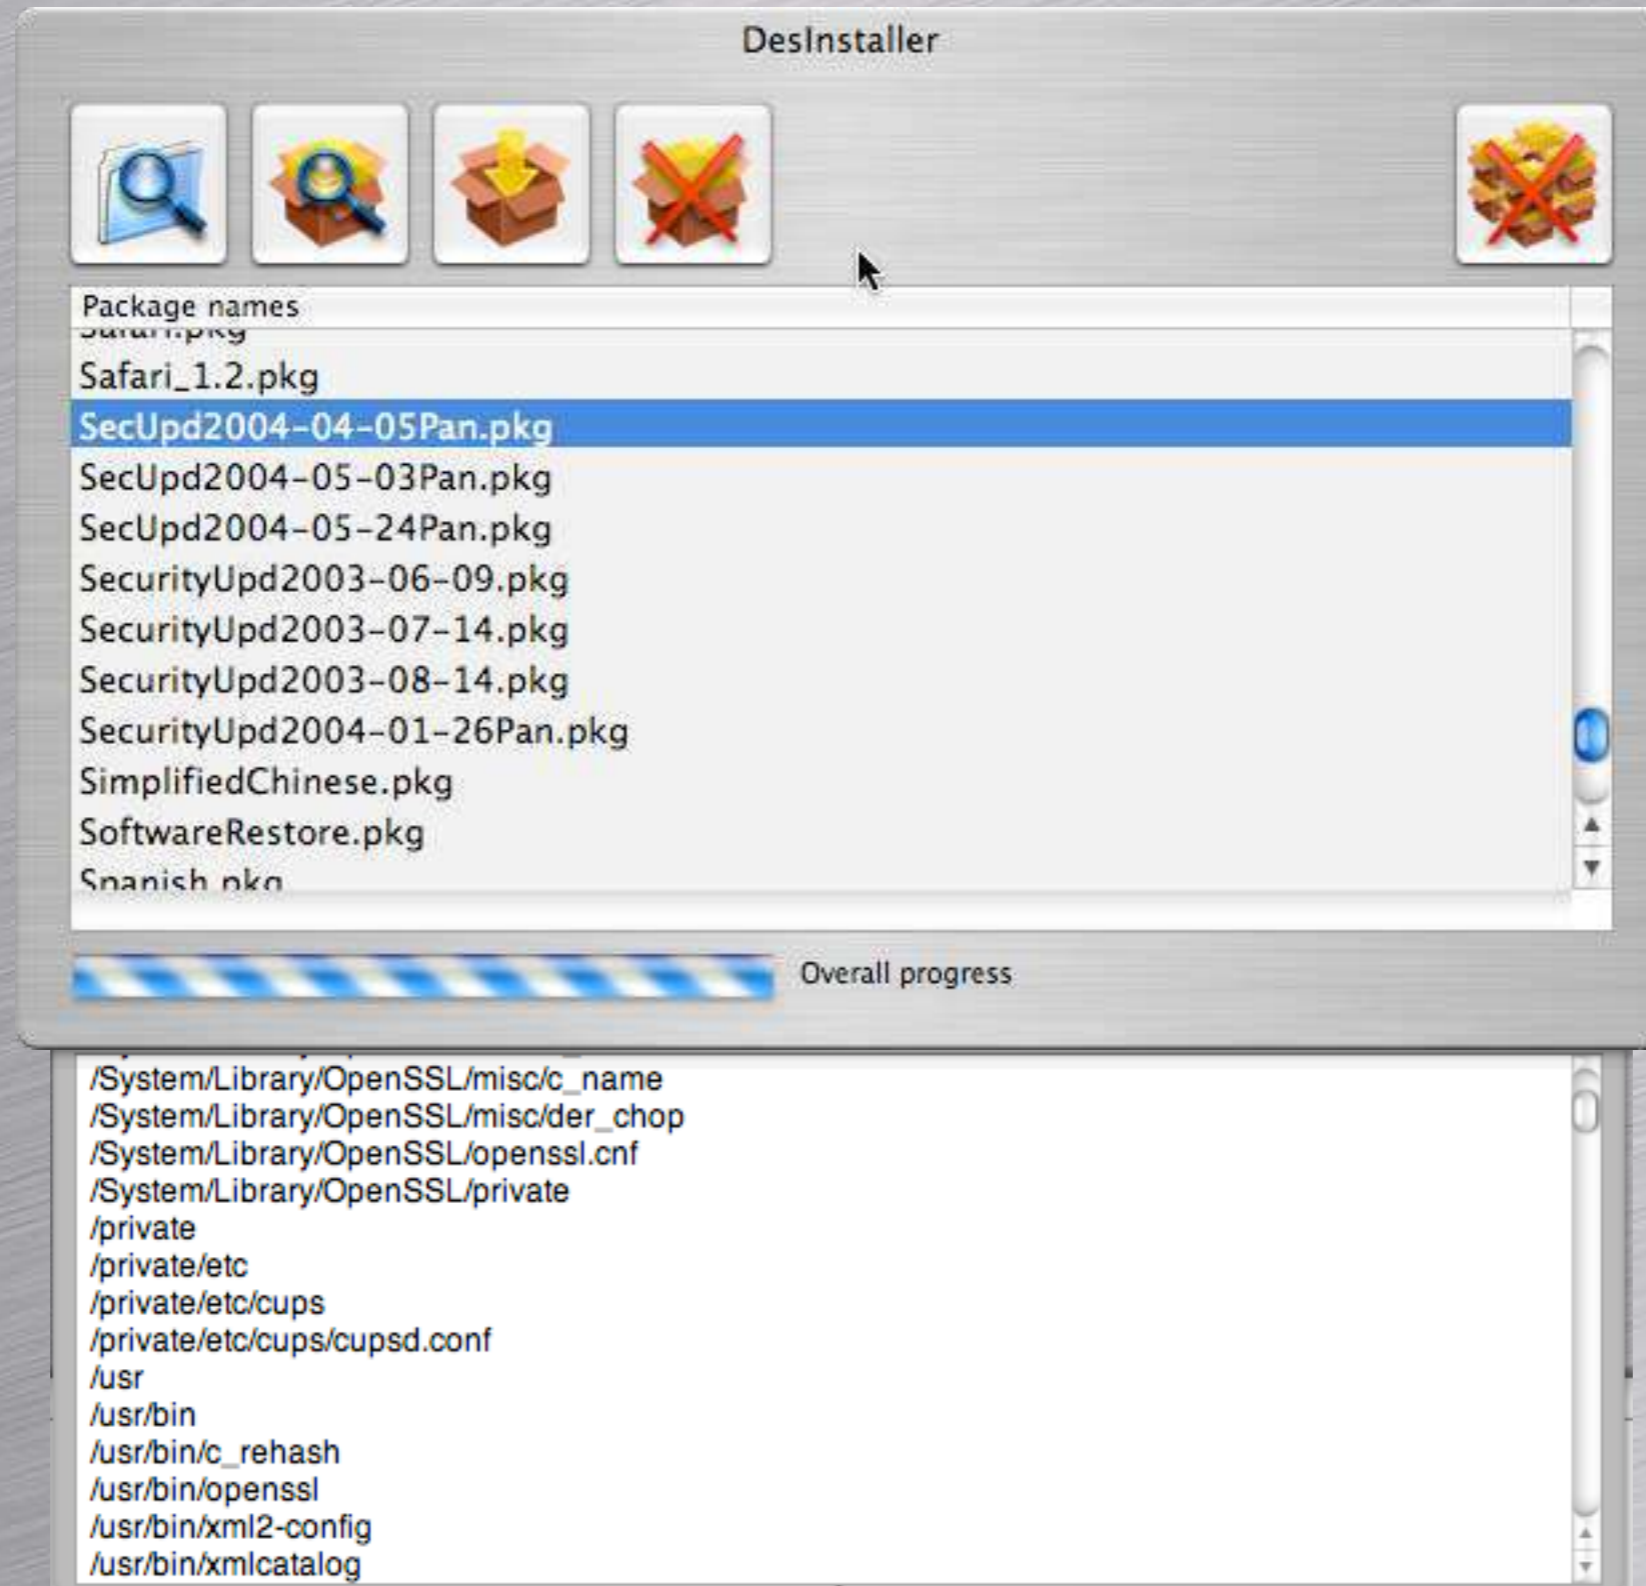

Uninstalling

- In most cases, simply drag app to Trash
- .plist files may be left in `~/Library/Preferences` but these are tiny and harmless and can be deleted or left
- Some apps are messier. **DesInstaller** is a big help (but use with caution)
 - Download from `http://krugazor.free.fr/software/desinstaller/DesInstaller.php` (free)
 - DesInstaller reads the Package Receipts in `/Library/Receipts`
 - The `lsbom` tool shows the same info (`man lsbom`)

Example: Uninstalling IE

DesInstaller

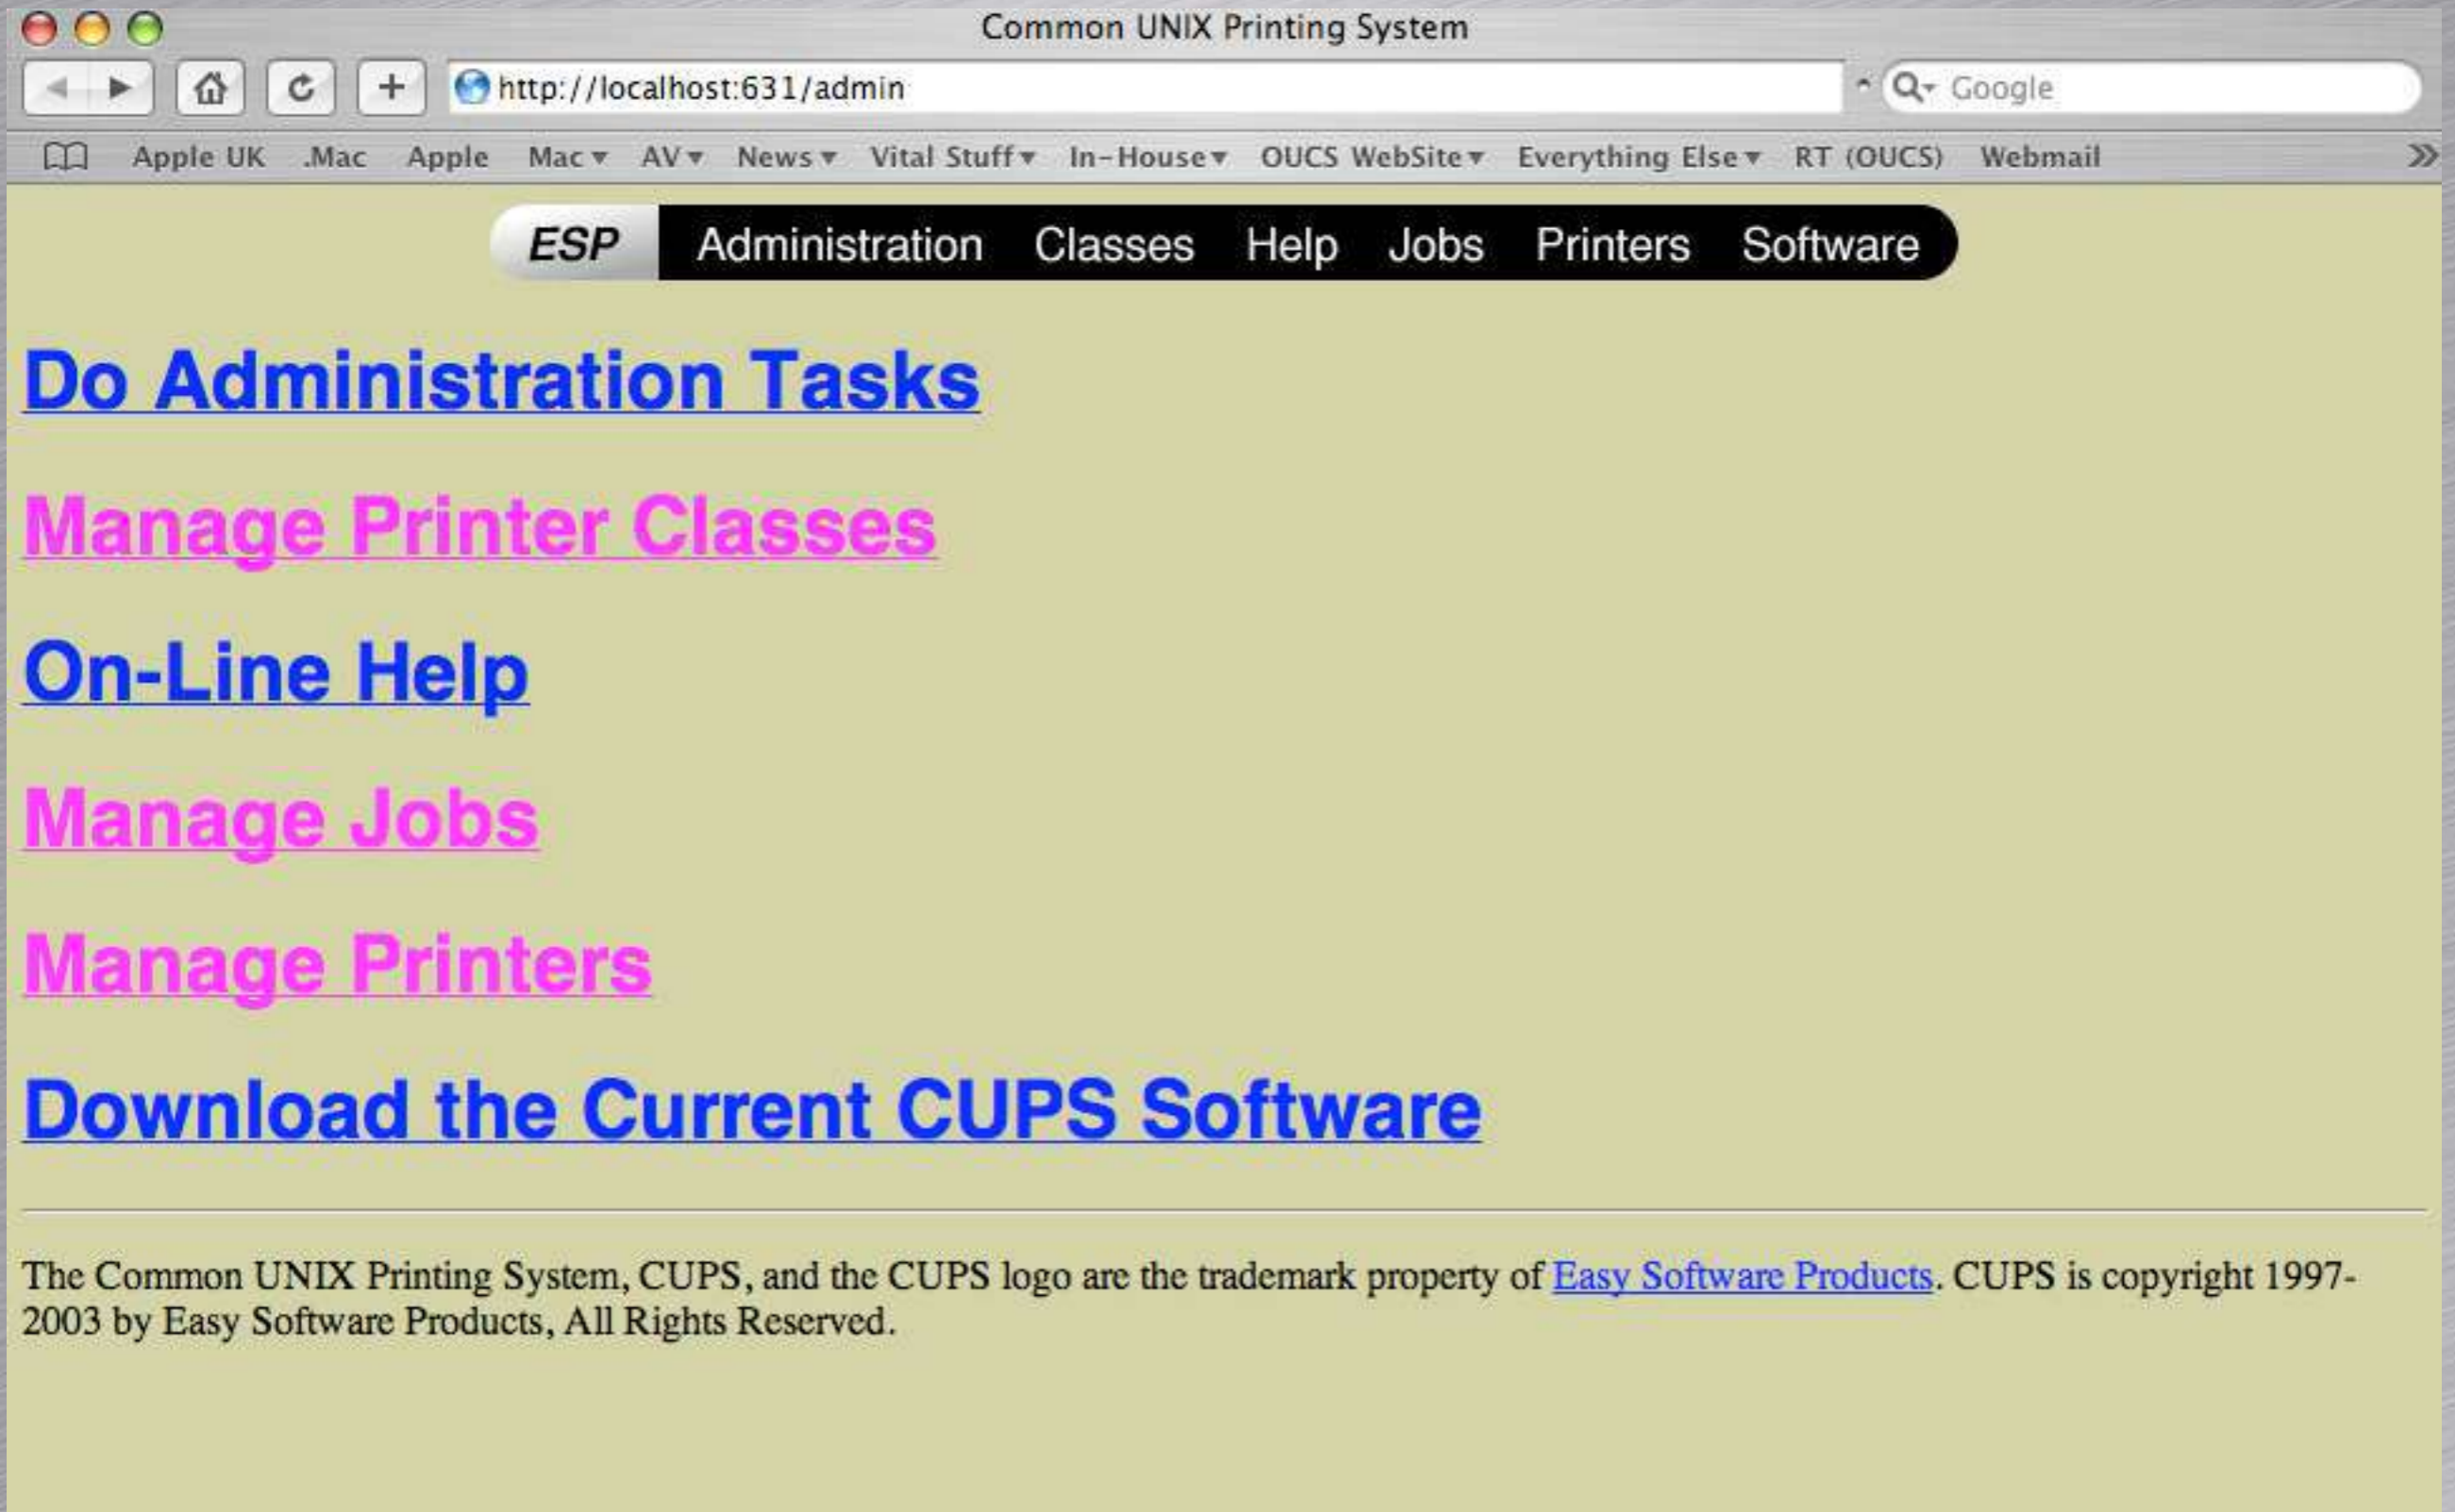

Printing

- OS X uses CUPS (Common Unix Printing System)
- Add and configure printers using / Applications/Utilities/Printer Setup Utility
- Further configuration using CUPS interface: **`http://localhost:631`**
- CUPS log files in **`/var/log/cups/`** (or use Console.app)

CUPS Interface

<http://localhost:631>

The screenshot shows a web browser window titled "Common UNIX Printing System". The address bar contains "http://localhost:631/admin". The browser's menu bar includes "Apple UK", ".Mac", "Apple", "Mac", "AV", "News", "Vital Stuff", "In-House", "OUCS WebSite", "Everything Else", "RT (OUCS)", and "Webmail". A search bar with the "Google" logo is visible. Below the browser window, a navigation menu is displayed with the following items: **ESP**, Administration, Classes, Help, Jobs, Printers, and Software. The main content area features several links:

- [Do Administration Tasks](#)
- [Manage Printer Classes](#)
- [On-Line Help](#)
- [Manage Jobs](#)
- [Manage Printers](#)
- [Download the Current CUPS Software](#)

The Common UNIX Printing System, CUPS, and the CUPS logo are the trademark property of [Easy Software Products](#). CUPS is copyright 1997-2003 by Easy Software Products, All Rights Reserved.

PS Binary Protocol

PS Binary Protocol:

Root user
must now be
enabled to
allow access
to these
options.

Enabling Root User

- Open /Applications/Utilities/Netinfo Manager
- Click on Security menu
- Select “Enable Root User”
- Use a **strong** password.
- Be **very careful** with Netinfo Manager

Software Update

Can be set to check for updates daily, weekly or monthly

In **Panther** this can be run straight from the  menu; in **Jaguar** it must be run from System Preferences.

Software Update Tips

- SU Preferences are in the System Preferences app.
- Default behaviour is to install ticked updates, but you can also “Download only” or “Install and keep package”
- Downloaded or kept packages are in `/Library/Packages` (useful for installing to several machines)
- Updates can be ignored. Detailed install logs in Console.app
- Read advice (especially <http://www.macfixit.com>) before plunging in with minor point upgrades. Don't be brave!
- **Always** repair permissions before and after installing a minor point upgrade
- Updates are also published and archived on <http://www.apple.com/uk/software/>

When *SU* goes wrong

- You backed up your computer beforehand anyway, so it's ok!
- Restart the computer and boot into 'Safe mode' or 'Single-user mode' to run **FSCK** (more on this later)
- If the Mac still won't start then try 3rd-party recovery software (e.g., Diskwarrior)

Kernel Panics

You need to restart your computer. Hold down the Power button for several seconds or press the Restart button.

Veillez redémarrer votre ordinateur. Maintenez la touche de démarrage enfoncée pendant plusieurs secondes ou bien appuyez sur le bouton de réinitialisation.

Sie müssen Ihren Computer neu starten. Halten Sie dazu die Einschalttaste einige Sekunden gedrückt oder drücken Sie die Neustart-Taste.

コンピュータを再起動する必要があります。パワーボタンを数秒間押し続けるか、リセットボタンを押してください。

- You'll need to force a restart
- On OS X 10.2 or later the panic is logged in `/Library/Logs/panic.log` (if you haven't reset PRAM)
- See <http://docs.info.apple.com/article.html?artnum=106228>) for instructions on how to tell Apple

You need to restart your computer. Hold down the Power button for several seconds or press the Restart button.

Veillez redémarrer votre ordinateur. Maintenez la touche de démarrage enfoncée pendant plusieurs secondes ou bien appuyez sur le bouton de réinitialisation.

Sie müssen Ihren Computer neu starten. Halten Sie dazu die Einschalttaste einige Sekunden gedrückt oder drücken Sie die Neustart-Taste.

コンピュータを再起動する必要があります。パワーボタンを数秒間押し続けるか、リセットボタンを押してください。

And if it won't start at all...?

Essential Software

- Install CDs
- Alsoft DiskWarrior
- CCC (Carbon Copy Cloner)
- TechTool Pro
- Norton Utilities

Major OS X Disk Utilities

• DiskWarrior 3.0 (with CD updater)

• <http://www.alsoft.com/DiskWarrior/index.html>

• TechTool Pro v.4

• <http://www.micromat.com/>

• Norton Utilities 8.0

• http://www.symantec.com/nu/nu_mac/index.html

Carbon Copy Cloner

<http://www.bombich.com/software/ccc.html>

- Mike Bombich is hugely respected in the Mac community
- Fantastic tool: use for backup and restore of clean installs
- Use for cloning and distributing known systems
- Clone volume before repartitioning drive
- Free for Education (otherwise donation ware)

Essential Hardware

- FireWire Drive (LaCie)
- Good FW Cable
- Another Mac

FireWire

- Two speeds: 400 and 800 Mbps
 - New drives have both + USB2
- Cheap cables are frequent cause of problems - buy good ones
- **Always** dismount drives cleanly before unplugging (⌘e)
- Check devices in System Profiler
- Blue & White G3 Macs *cannot* boot from FireWire drives, most others can
- Some compatibility issues with multiple FW devices
- If device won't show, unplugging Mac completely from power supply and leaving for 5 mins can help

Start-up Keys

⌘ ⌥ of	Open Firmware
⌘ ⌥ pr	Reset PRAM
t	FireWire Target Disk Mode
⌥	Startup Manager
⌘ s	Single User Mode
⌘ v	Verbose Mode
n	NetBoot (boot from network)
c	Boot from CD / DVD
x	Boot into OS X
⌘ (immediately at startup)	Safe Boot
⌘ (after boot, until login)	Override auto-login

PRAM and NVRAM

- In OS X, PRAM contains the following:
 - Time zone setting
 - Choice of start-up volume
 - Speaker volume
 - Kernel panic record (if any)
 - DVD region setting
- Reset thus:
 - Turn computer off, then on again
 - Hold down $\text{⌘} \text{⌥} \text{pr}$ keys before grey screen appears
 - Keep holding the keys down until you hear the startup chime again

Open Firmware

For Macs in a public area it's a good idea to password protect the Open Firmware. This prevents:

- Startup from CD (c)
- Startup from Network (n)
- Startup in Target Disk Mode (t)
- Startup in Single User (⌘s) or Verbose (⌘v) Mode
- Blocks a PRAM reset ($\text{⌘} \text{⌘pr}$)
- Access to Open Firmware ($\text{⌘} \text{⌘of}$) blocked without password
- Password required for Startup Manager (⌘)

Safe Boot / Single User Mode

- Hold down shift key (⇧) at startup - this starts the computer in 'Safe mode':
 - forces a directory check of the startup volume
 - loads only required kernel extensions
 - loads only Apple startup items
- Can also boot into Single-user mode with ⌘s and run:
 - (On Jaguar): `/sbin/fsck -y`
 - (On Panther): `/sbin/fsck -fy` (but better to safe boot)

If this still doesn't work then try resetting PRAM and NVRAM

- Other bad signs:
 - Broken folder icon
 - Plain blue or grey screen
 - Kernel Panic
 - Flashing question mark
 - "Forbidden" icon

<http://docs.info.apple.com/article.html?artnum=106464>

<http://docs.info.apple.com/article.html?artnum=58042>

Maintenance

- Maintenance
 - Disk permissions
 - Cron jobs (Cronnix)
 - Prebinding: `sudo update_prebinding -root / -force`
 - Using maintenance tools: Onyx, TinkerTool, Xupport, etc.

Cronned scripts

- **periodic daily:** 03:15 every day
- **periodic weekly:** 04:30 every Saturday
- **periodic monthly:** 05:30 on the 1st of every month

The screenshot shows the CronniX application window with a toolbar and a table of cron jobs. The toolbar includes icons for New, Delete, Open, Save, Current crontab, Edit, and Run Now. The table lists three cron jobs with their respective schedules and commands.

	Min	Hour	Mday	Month	Wday	User	Command
<input checked="" type="checkbox"/>	15	3	*	*	*	root	periodic daily
<input checked="" type="checkbox"/>	30	4	*	*	6	root	periodic weekly
<input checked="" type="checkbox"/>	30	5	1	*	*	root	periodic monthly

How do I configure stuff?

- Network

- Use System Preferences / Network

- Mail Client

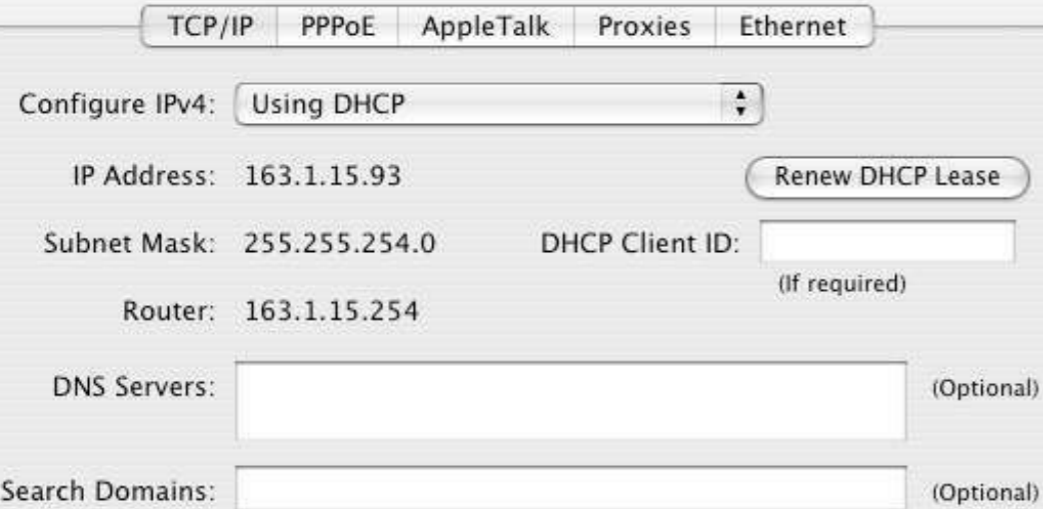

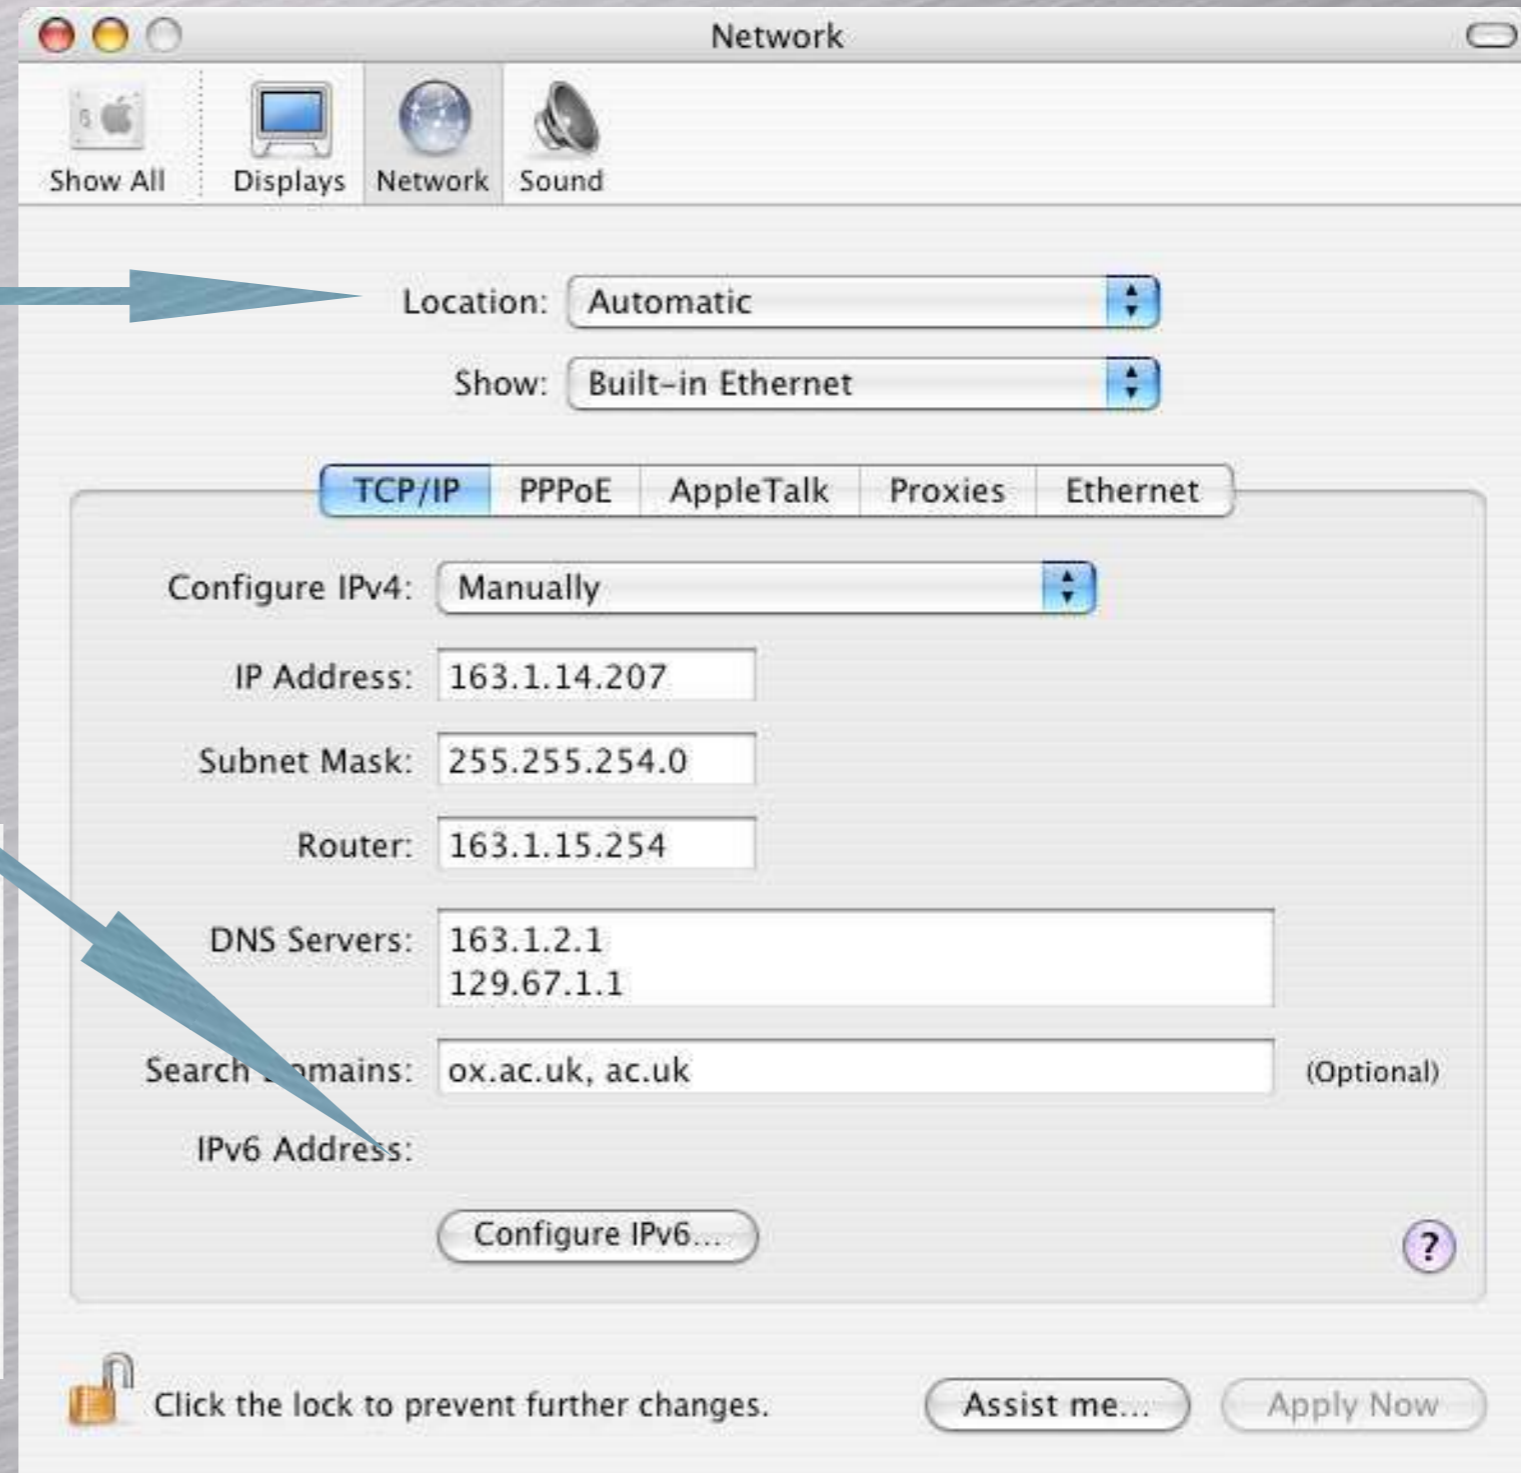

- Mail.app

- Browsers

- Safari is default browser
- Mozilla, Firefox, Camino, Opera are all excellent too

Network Settings

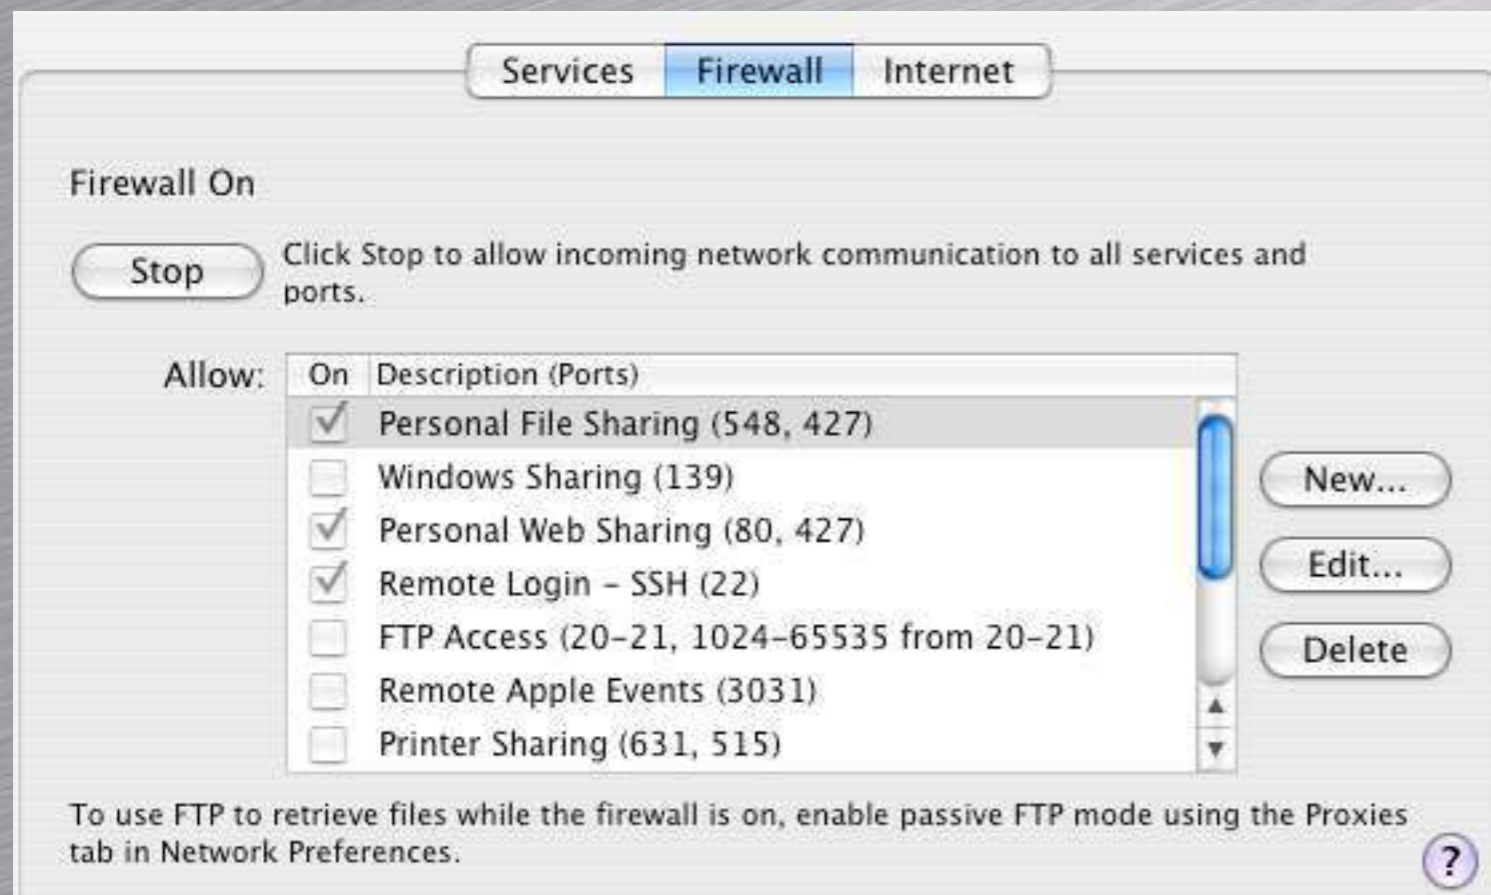

- Trivial to set up multiple locations
- Turn off IPv6 (Panther only)

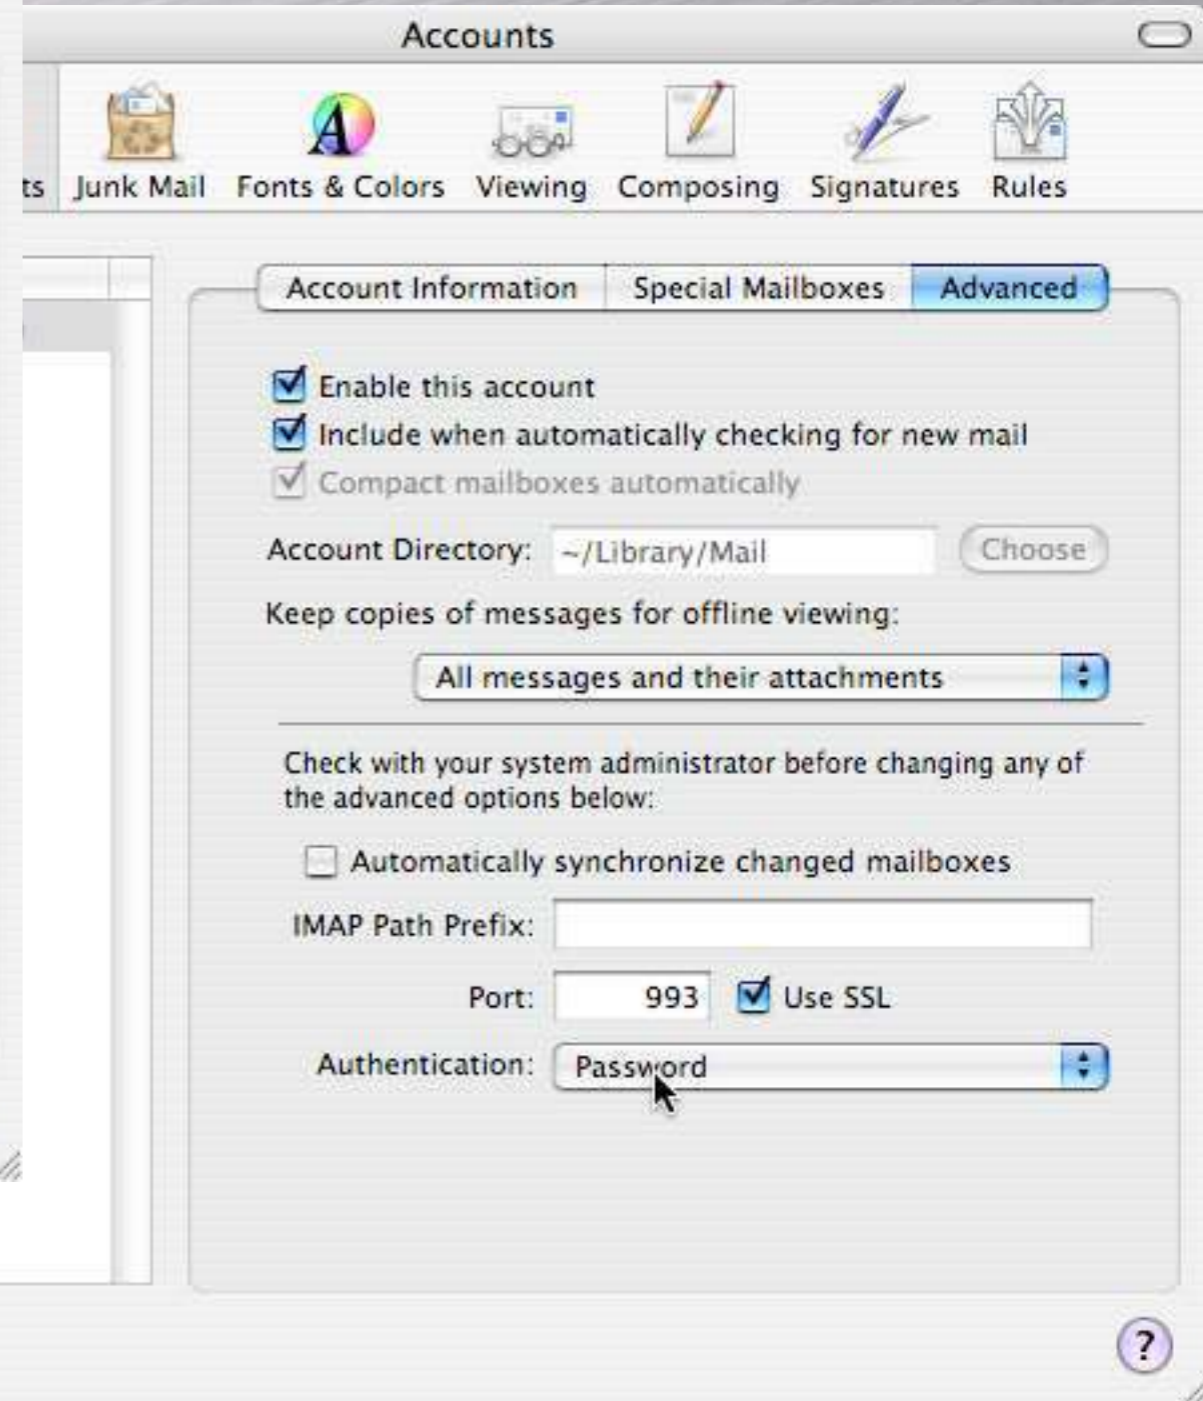

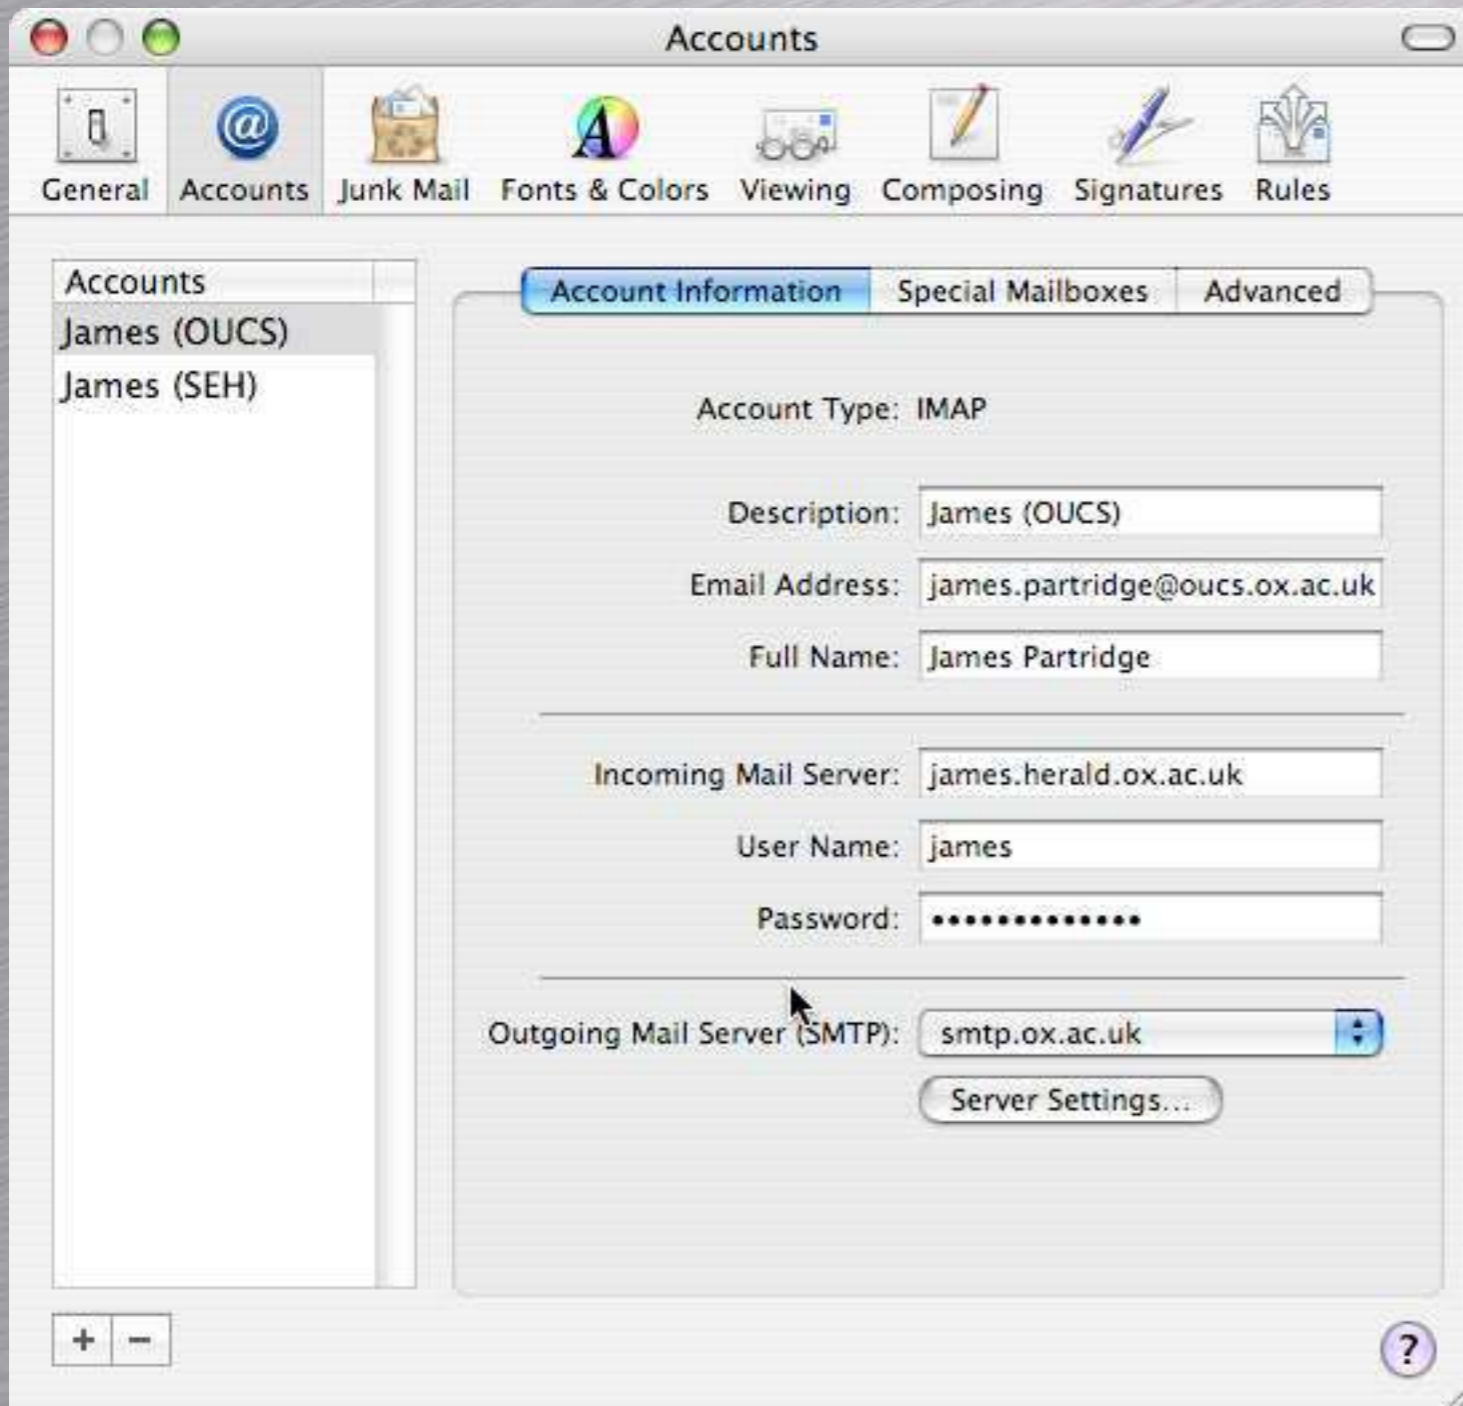

DHCP

FireWall

Found in System Preferences / Sharing

Mail.app

Mail / Preferences

Anti-Virus

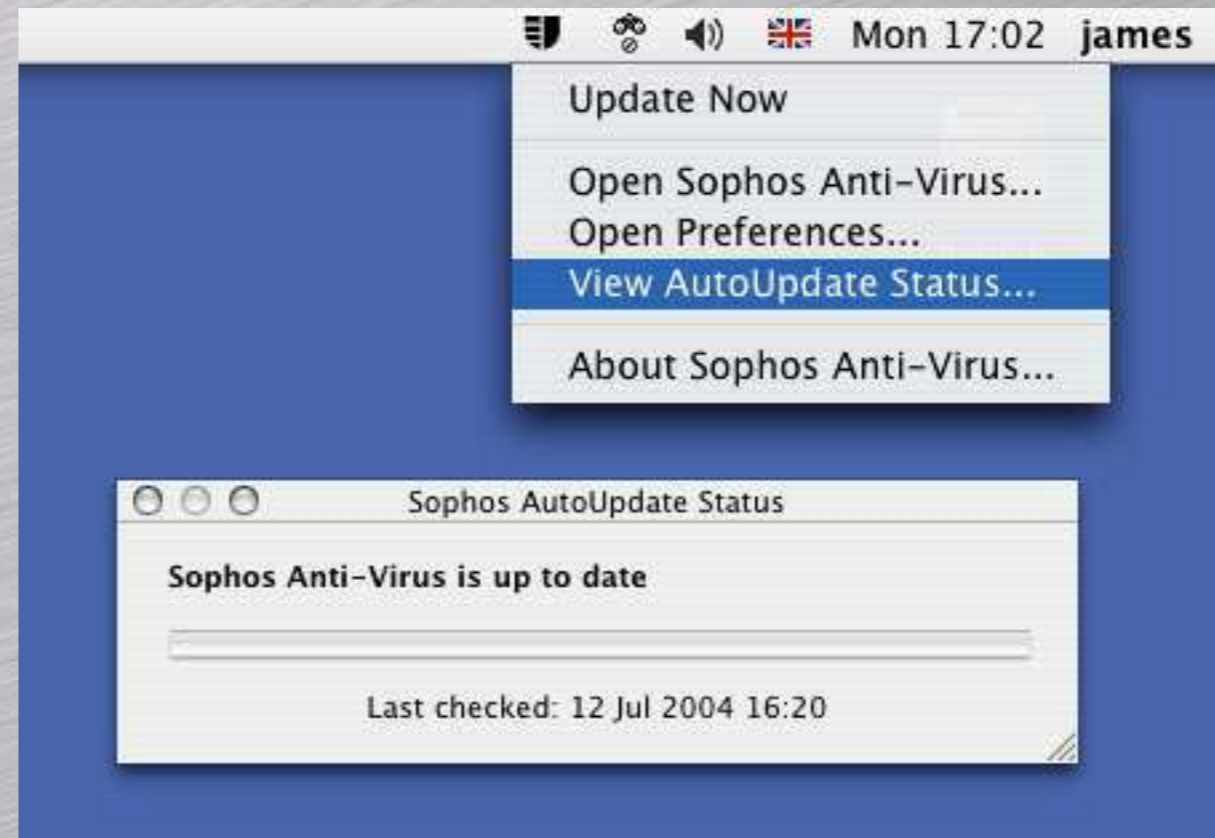

- No OS X-specific viruses; no Mac virus outbreaks for over 5 years
- Word macro viruses can still be a problem
- Macs can be “carriers”
- Use AV software

AV Products

- Sophos Anti-Virus 10.2+
- McAfee Virex 6.2
- Norton Anti-Virus 9.0

Sophos 10.2+ Client

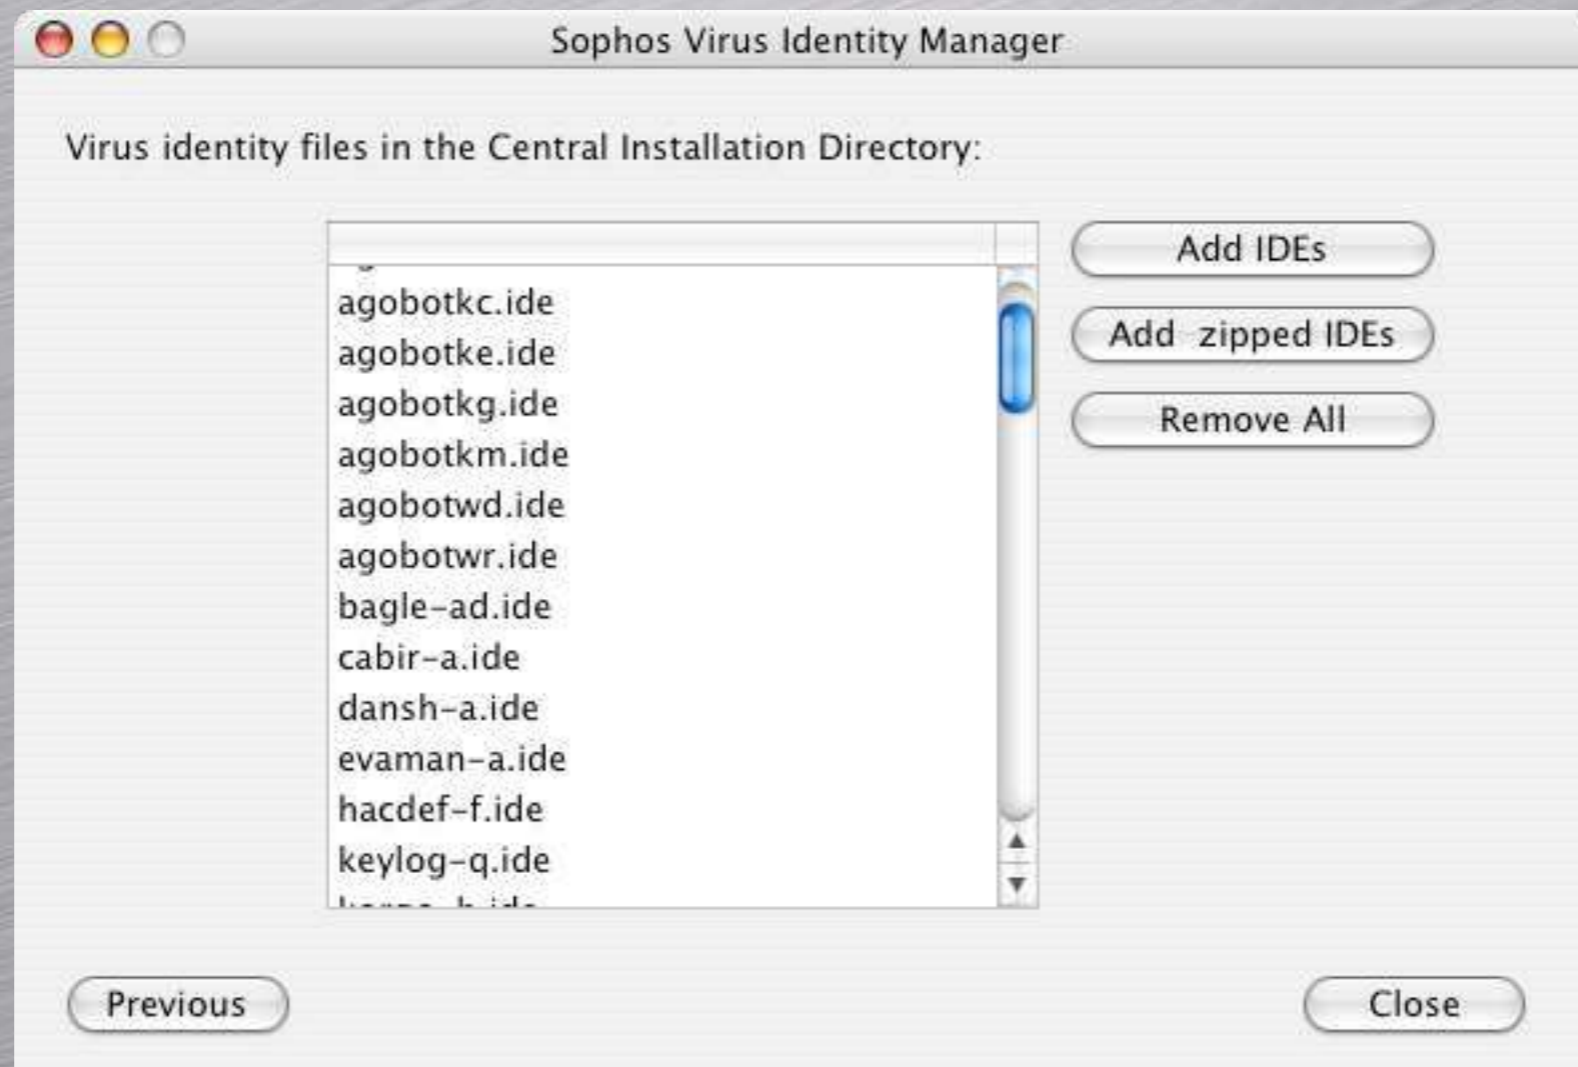

**Now auto-updates
(like the Windows
client) when
connected to a CID
on a Mac or Windows
server.**

Sophos CID on OS X Server

Sophos CID on OS X Server

A few tips and tricks

- .Mac
- Exposé
- Spring-loaded folders
- Finder
- Dock
- PDF trickery
- Services
